

TOSHIBA CCD LINEAR IMAGE SENSOR CCD (Charge Coupled Device)

# TCD2503C

The TCD2503C is a high sensitive and low dark current 5000 elements x 3 line CCD color image sensor. The sensor is designed for color scanner. The device contains a row of 5000 elements x 3 line photodiodes which provide a 16 lines/mm across a A3 size paper. The device is operated by 5 V pulse, and 12 V power supply.

**FEATURES**

- Number of Image Sensing Element : 5000 elements x 3 line
- Image Sensing Element Size : 14 μm by 14 μm on 14 μm centers
- Photo Sensing Region : High sensitive pn photodiode
- Clock : 2 Phase (5 V)
- Distance Between Photodiode Array : 84 μm (6 lines)
- Internal Circuit : Clamp circuit
- Package : 24 pin DIP
- Color Filter : Red, Green, Blue

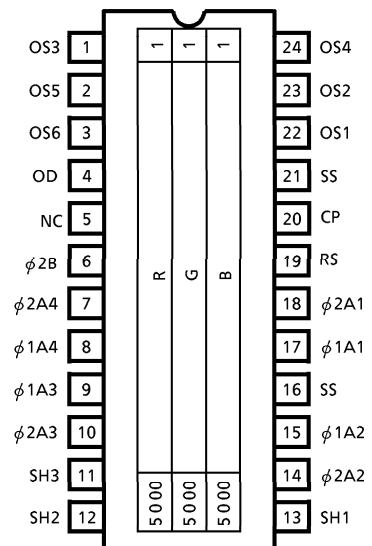

Weight : 17.1 g (Typ.)

**MAXIMUM RATINGS (Note 1)**

CHARACTERISTIC	SYMBOL	RATING	UNIT
Clock Pulse Voltage	$V_{\phi}$	- 0.3~8	V
Shift Pulse Voltage	$V_{SH}$		
Reset Pulse Voltage	$V_{RS}$		
Clamp Pulse Voltage	$V_{CP}$		
Power Supply Voltage	$V_{OD}$	- 0.3~15	V
Operating Temperature	$T_{opr}$	0~60	°C
Storage Temperature	$T_{stg}$	- 25~85	°C

(Note 1) : All voltage are with respect to SS terminals (Ground).

(Note 2) : Sensivity is defined for each color of signal outputs average when the photosensitive surface is applied with the light of uniform illumination and uniform color temperature.

(Note 3) : PRNU (1) is defined for each color on a single chip by the expressions below when the photosensitive surface is applied with the light of uniform illumination and uniform color temperature.

$$PRNU (1) = \frac{\Delta\bar{x}}{\bar{x}} \times 100 (\%)$$

Where  $\bar{x}$  is average of total signal output and  $\Delta\bar{x}$  is the maximum deviation from  $\bar{x}$ .

(Note 4) : PRNU (3) is defined as maximum voltage with next pixel, where measured 5% of SE (Typ.).

(Note 5) :  $V_{SAT}$  is defined as minimum Saturation Output voltage of all effective pixels.

(Note 6) : Definition of SE

$$SE = \frac{V_{SAT}}{R_G}$$

(Note 7) :  $V_{DRK}$  is defined as average dark signal voltage of all effective pixels.

(Note 8) : DSNU is defined as different voltage between  $V_{DRK}$  and  $V_{MDK}$ , when  $V_{MDK}$  is maximum dark signal voltage.

(Note 9) : DC Signal Output Voltage is defined as follows:

(Note 10) : Random noise is defined as the standard deviation ( $\sigma$ ) of the output level difference between two adjacent effective pixels under no illumination (i.e. dark conditions) calculated by the following procedure.

- 1) Two adjacent pixels (pixel n and n + 1) in one reading are fixed as measurement points.
- 2) Each of the output levels at video output periods averaged over 200 ns period to get  $V_n$  and  $V(n + 1)$ .
- 3)  $V(n + 1)$  is subtracted from  $V_n$  to get  $\Delta V$ .

$$\Delta V = V_n - V(n + 1)$$

- 4) The standard deviation of  $\Delta V$  is calculated after procedure 2) and 3) are repeated 30 times (30 readings).

$$\overline{\Delta V} = \frac{1}{30} \sum_{i=1}^{30} |\Delta V_i| \quad \sigma = \sqrt{\frac{1}{30} \sum_{i=1}^{30} (|\Delta V_i| - \overline{\Delta V})^2}$$

- 5) Procedure 2), 3) and 4) are repeated 10 times to get 10 sigma value.

$$\overline{\sigma} = \frac{1}{10} \sum_{j=1}^{10} \sigma_j$$

- 6)  $\overline{\sigma}$  value calculated using the above procedure is observed  $\sqrt{2}$  times larger than that measured relative to the ground level. So we specify random noise as follows.

$$\text{Random noise} = \frac{1}{\sqrt{2}} \overline{\sigma}$$

TYPICAL DRIVE CIRCUIT

**PRECAUTIONS FOR USE OF CCD IMAGE SENSOR****1. Static Electricity**

This device has some weakly terminals for static electricity. Therefore, please pay attention to treat this device.

CCD Image Sensor is protected against static electricity, but inferior puncture mode device due to static electricity is sometimes detected. In handling the device, it is necessary to execute the following static electricity preventive measures, in order to prevent the trouble rate increase of the manufacturing system due to static electricity.

- a. Prevent the generation of static electricity due to friction by making the work with bare hands or by putting on cotton gloves and non-charging working clothes.
- b. Discharge the static electricity by providing earth plate or earth wire on the floor, door or stand of the work room.
- c. Ground the tools such as soldering iron, radio cutting plier or pincette.  
It is not necessarily required to execute all precaution items for static electricity.  
It is all right to mitigate the precautions by confirming that the trouble rate within the prescribed range.

**2. Window Glass**

As the dust and station on the glass window of the package will cause black flow on the picture, never fail to clean the glass surface before using. (Blow compressed vapor, and wipe off the dust, and dirt with soft cloth or paper slightly moistened with alcohol).

Fully take care for the handling of the device as the window glass will break or a strong friction is given to the window glass surface.

**3. Incident Light**

CCD image sensor has sensitivity in a wide range zone of light wave length, but its characteristics will sometimes widely change when used with long wave length input light outside the visual light zone.
