DESCRIPTION

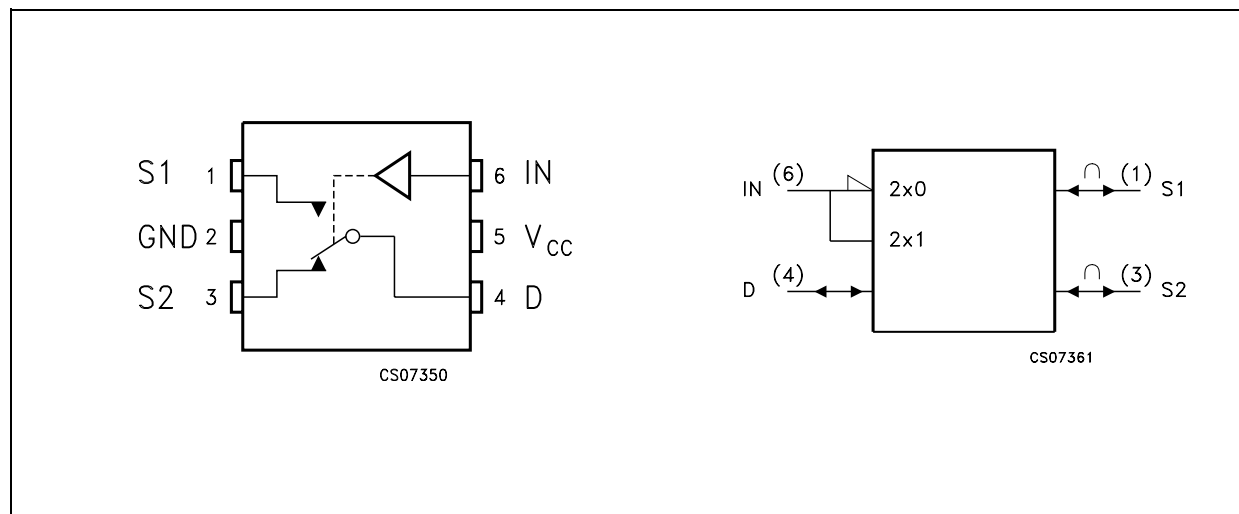

The STG3157 is an high-speed spdt CMOS ANALOG S.P.D.T. (Single Pole Dual Throw) SWITCH or 2:1 Multiplexer/Demultiplexer Bus Switch fabricated in silicon gate C²MOS technology. It designed to operate from 1.65V to 5.5V, making this device ideal for portable applications.

It offers very low ON-Resistance ($<9\Omega$) at $V_{CC} = 3.0V$. The IN input is provided to control the S.P.D.T. switch, it's compatible with standard

CMOS output. The switch S1 is ON (it is connected to common Port D) when the IN input is held high and OFF (high impedance state exists between the two ports) when IN is held low; the switch S2 is ON (it is connected to common Port D) when the IN input is held low and OFF (high impedance state exists between the two ports) when IN is held high. Additional key features are fast switching speed, Break Before Make Delay Time and Very Low Power Consumption. All inputs and output are equipped with protection circuits against static discharge, giving them ESD immunity and transient excess voltage.

It's available in the commercial temperature range in smallest six lead smd package on the market.
