

TOSHIBA BIPOLAR LINEAR INTEGRATED CIRCUIT SILICON MONOLITHIC

**TA8637BP****VHF MODULATOR FOR VCR OR VDP****FEATURES**

- Video clamp
- White clip
- Main carrier oscillator
- Main carrier attenuator
- Video Modulator
- Sound Modulator
- Sound FM Modulator
- Channel Switch
- Low power operation
- Adjustable output level and V/A ratio with external resistance.
- Minimum number of external parts required.
- Regulator circuit is included.
- Operating voltage range : 4.5V~5.5V, Typ. 5V
- Suggested operating voltage : 4.75V~5.25V, Typ. 5V

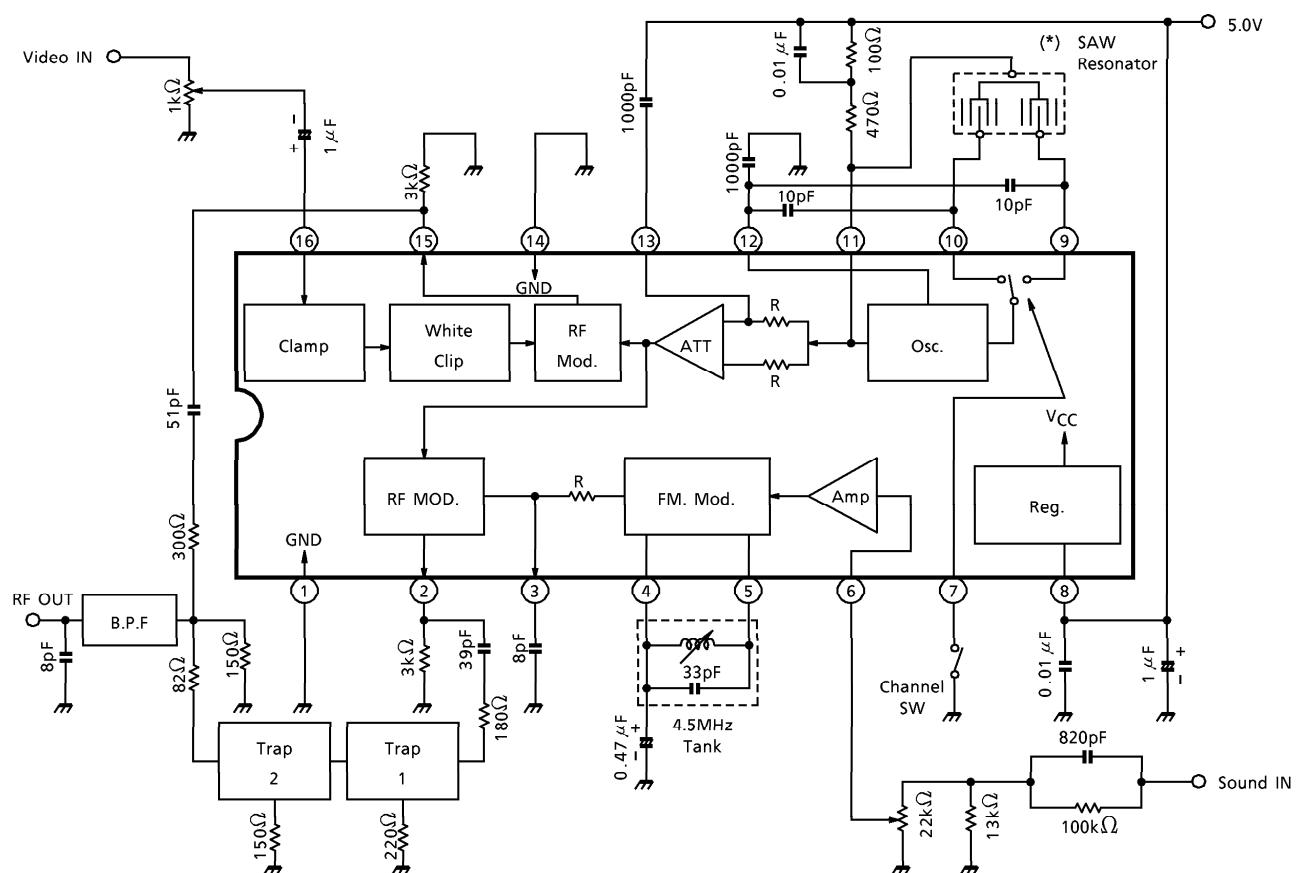

Weight : 1.11g (Typ.)

- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

- (Note 1) Measure RF level by spectrum analyzer (Input impedance = 50) and calculate measurement data  $V_O$  (dBm) by  
 $\text{Output Level (dB}\mu\text{V)} = V_O + 107 + 16 \text{ (dB}\mu\text{V)}$
- (Note 2) Measure after that demodulated by the standard demodulator (For example Tektronix 1450).
- (Note 3) Adjust a sound FM center frequency to 4.500MHz at  $T_a = 25^\circ\text{C}$ , then measure a frequency drift at  $T_a = 0\sim 60^\circ\text{C}$  for at  $T_a = 25^\circ\text{C}$ .  
 This spec ( $\Delta f_s$ ) does not include TANK temperature coefficient.
- (Note 4) Connect  $V_a + 0.2$  (V) and  $V_a - 0.2$  (V) to  $V_1$  ( $V_a$  ; #6 terminals open voltage) then measure each frequency and calculate by

$$\beta_s = \frac{\text{Frequency difference between } V_1 = V_a + 0.2 \text{ and } V_2 = V_a - 0.2}{0.4}$$

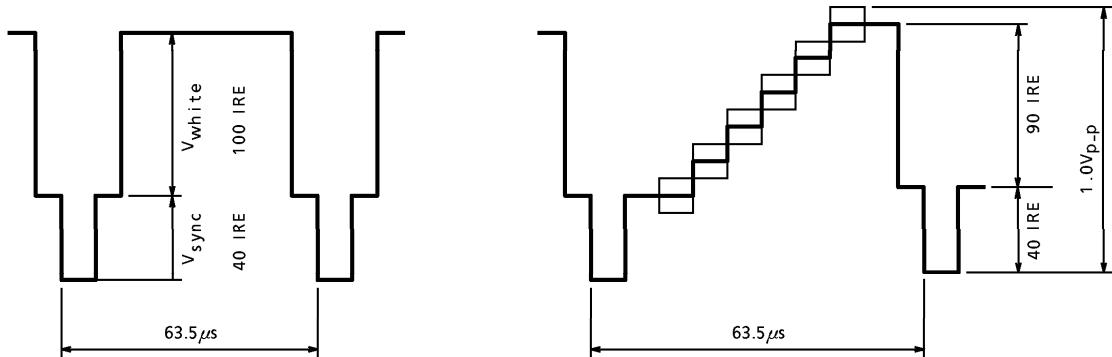

- (Note 5) Adjust  $V_{i2}$  level so that FM deviation become  $\pm 20\text{kHz}$ , then measure THD after that demodulate by standard demodulator (for example tektronix 1450)
