INTRODUCTION

The KS0652 is a 300 / 309 channel output, TFT-LCD source driver for an 64 gray-scale LCD panel. Data input is based on digital input consisting of 6 bits by 3 dots, which can realize a full-color display of 260,000 color by output of 64 values gamma-corrected.

This device has an internal D/A (digital-to-analog) converter for each output and 18 (9-by-2) reference voltages. Because the output dynamic range is as large as 6.0 - 12.6 Vp-p, it is unnecessary to operate level inversion of the LCD's common electrode. Besides, to be able to deal with dot-line inversion when mounted on a single-side, output gray-scale voltages with different polarity can be output to the odd number output pins and the even output pins.

KS0652 can be adopted to larger panel, and SHL (shift direction selection) pin makes the use of the LCD panel connection conveniently. Maximum operation clock frequency is 55 MHz at 2.7 V logic operation, single edge and it can be applied to the TFT-LCD panel of SVGA to XGA standard.

PIN DESCRIPTIONS

Symbol	Pin Name	Description
VDD1	Logic power supply	2.7 - 3.6 V
VDD2	Driver power supply	6.4 - 13.0 V
VSS1	Logic ground	Ground (0 V)
VSS2	Driver ground	Ground (0 V)
Y1 - Y309	Driver outputs	The D/A converted 64 gray-scale analog voltage is output.
D0<0:5> - D2<0:5>	Display data input	The display data is input with a width of 18 bits, gray-scale data (6 bits) by 3 dots (R,G,B) DX0: LSB, DX5: MSB
SHL	Shift direction control input	This pin controls the direction of shift register in cascade connection. The shift direction of the shift registers is as follows. SHL = H: DIO1 input, Y1 → Y309, DIO2 output SHL = L: DIO2 input, Y309 → Y1, DIO1 output
DIO1	Start pulse input / output	SHL = H: Used as the start pulse input pin SHL = L: Used as the start pulse output pin
DIO2	Start pulse input / output	SHL = H: Used as the start pulse output pin SHL = L: Used as the start pulse input pin
POL	Polarity input	POL = H: The reference voltage for odd number outputs are VGMA1 – VGMA9 and those for even number outputs are VGMA10 – VGMA18 POL = L: The reference voltage for odd number outputs are VGMA10 – VGMA18 and those for even number outputs are VGMA1 – VGMA9
CLK2	Shift clock input	Refer to the shift register's shift clock input. The display data is loaded to the data register at the rising edge of CLK2.
CLK1	Latch input	Latches the contents of the data register at rising edge and transfers them to the D/A converter. Also, after CLK1 input, clears the internal shift register contents. After 1 pulse input on start, operates normally. CLK1 input timing refers to the "Relationships between CLK1 start pulse (DIO1, DIO2) and blanking period" of the switching characteristic waveform. Outputs the gray-scale data at rising edge.
VGMA1 – VGMA18	Gamma corrected power supplies	Input the gamma corrected power supplies from external source. VDD2 > VGMA1 > VGMA2 > > VGMA17 > VGMA18 > VSS2 Keep gray-scale power supply unchanged during the gray-scale voltage output.
SELT	Output selection input	SELT = H: 300 Output (Y151 - Y159 are disabled) SELT = L: 309 Output
TESTB	Test input	TESTB = H: Normal operation mode TESTB = L: Test mode (OP AMP CUT-OFF, Rpu = 30kΩ)

OPERATION DESCRIPTION

DISPLAY DATA TRANSFER

When DIO1 (or DIO2) pulse is loaded into internal latch on the rising edge of CLK2, DIO1 (or DIO2) pulse enables the data transfer operation. After the falling edge of DIO1 (or DIO2), display data is valid on the rising edge of CLK2. Once all the data of 300 / 309 channels are loaded into internal latch, it goes into stand-by state automatically, and any new data is not accepted even though CLK2 is provided until next DIO1 (or DIO2) input. When next DIO1 (or DIO2) is provided, new display data is valid on the next rising edge of CLK2 after the falling edge of DIO1 (or DIO2).

EXTENSION OF OUTPUT

Output pin can be adjusted to an extended screen by cascade connection.

(1) SHL = "L"

Connect DIO1 pin of previous stage to the DIO2 pin of next stage and all the input pins except DIO1 and DIO2 are connected together in each device.

(2) SHL = "H"

Connect DIO2 pin of previous stage to the DIO1 pin of next stage and all the input pins except DIO2 and DIO1 are connected together in each device.

RELATIONSHIP BETWEEN INPUT DATA VALUE AND OUTPUT VOLTAGE

The LCD drive output voltages are determined by the input data and 18 (9-by-2) gamma corrected power supplies (VGMA1 - VGMA18). Besides, to be able to deal with dot-line inversion when mounted on a single-side, gradation voltages with different polarity can be output to the odd number output pins and the even number output pins. Among 9-by-2 gamma corrected voltages, input gray-scale voltages of the same polarity with respect to the common voltage, for the respective 9 gamma corrected voltages of VGMA1 - VGMA9 and VGMA10 - VGMA18.

CAUTIONS:

If LSIs are stressed beyond those listed above “absolute maximum ratings”, they may be permanently destroyed. These are stress ratings only, and functional operation of the device at these or any other condition beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
 Turn on power order: VDD1 → control signal input → VDD2 → VGMA1 - VGMA18
 Turn off power order: VGMA1 - VGMA18 → VDD2 → control signal input → VDD1
