Description

CD4527BMS is a low power 4-bit digital rate multiplier that provides an output pulse rate which is the clock input pulse rate multiplied by 1/10 times the BCD input. For example, when the BCD input is 8, there will be 8 output pulses for every 10 input pulses. This device may be used to perform arithmetic operations (add, subtract, divide, raise to a power), solve algebraic and differential equations, generate natural logarithms and trigonometric functions, A/D and D/A conversion, and frequency division.

For fractional multipliers with more than one digit, CD4527BMS devices may be cascaded in two different modes: the Add mode and the Multiply mode (see Figures 9 and 11). In the Add mode,

$$\text{Output Rate} = (\text{Clock Rate}) [0.1\text{BCD}1 + 0.01\text{BCD}2 + 0.001\text{BCD}3 + \dots]$$

In the Multiply mode, the fraction programmed into the first rate multiplier is multiplied by the fraction programmed into the second one,

$$\text{e.g. } \frac{9}{10} \times \frac{4}{10} = \frac{36}{100} \text{ or 36 output}$$

pulses for every 100 clock input pulses.

The CD4527BMS is supplied in these 16-lead outline packages:

* Clear and Set Inputs should not be high at the same time; device draws increased quiescent current when in this non-valid state.

** Depends on internal state of counter.

*** Output same as the first 16 lines of this truth table (depending on values of A, B, C, D).
