**MJ13081**

**MOTOROLA**  
**SEMICONDUCTOR**  
TECHNICAL DATA

**Designer's Data Sheet**

**SWITCHMODE II SERIES**  
**NPN SILICON POWER TRANSISTORS**

The MJ13080 and MJ13081 transistors are designed for high-voltage, high-speed, power switching in inductive circuits where fall time is critical. They are particularly suited for line-operated switch-mode applications such as:

- Switching Regulators
- Inverters
- Solenoid and Relay Drivers
- Motor Controls
- Deflection Circuits

**Fast Turn-Off Times**

- 100 ns Inductive Fall Time @ 25°C (Typ)
- 150 ns Inductive Crossover Time @ 25°C (Typ)
- 400 ns Inductive Storage Time @ 25°C (Typ)

Operating Temperature Range -65 to +200°C

**100°C Performance Specified for:**

- Reverse-Biased SOA with Inductive Loads
- Switching Times with Inductive Loads
- Saturation Voltages
- Leakage Currents

**8 AMPERE**

**NPN SILICON**  
**POWER TRANSISTORS**

**400 AND 450 VOLTS**  
**150 WATTS**

**Designer's Data for**  
**"Worst Case" Conditions**

The Designer's Data Sheet permits the design of most circuits entirely from the information presented. Limit data — representing device characteristics boundaries — are given to facilitate "worst case" design.

**MAXIMUM RATINGS**

Rating	Symbol	MJ13080	MJ13081	Unit
Collector-Emitter Voltage	V <sub>CEO</sub>	400	450	Vdc
Collector-Emitter Voltage	V <sub>CEV</sub>	650	750	Vdc
Emitter Base Voltage	V <sub>EB</sub>	6.0		Vdc

SWITCHING TIMES NOTE

In resistive switching circuits, rise, fall, and storage times have been defined and apply to both current and voltage waveforms since they are in phase. However, for inductive loads which are common to SWITCHMODE power supplies and hammer drivers, current and voltage waveforms are not in phase. Therefore, separate measurements must be made on each waveform to determine the total switching time. For this reason, the following new terms have been defined.

- $t_{sv}$  = Voltage Storage Time, 90%  $I_{B1}$  to 10%  $V_{clamp}$
  - $t_{rv}$  = Voltage Rise Time, 10–90%  $V_{clamp}$
  - $t_{fi}$  = Current Fall Time, 90–10%  $I_C$
  - $t_{ti}$  = Current Tail, 10–2%  $I_C$
  - $t_c$  = Crossover Time, 10%  $V_{clamp}$  to 10%  $I_C$
- An enlarged portion of the inductive switching waveforms

is shown in Figure 7 to aid in the visual identity of these terms.

For the designer, there is minimal switching loss during storage time and the predominant switching power losses occur during the crossover interval and can be obtained using the standard equation from AN-222:

$$P_{SWT} = 1/2 V_{CC} I_C (t_c) f$$

In general,  $t_{rv} + t_{fi} \approx t_c$ . However, at lower test currents this relationship may not be valid.

As is common with most switching transistors, resistive switching is specified at 25°C and has become a benchmark for designers. However, for designers of high frequency converter circuits, the user oriented specifications which make this a "SWITCHMODE" transistor are the inductive switching speeds ( $t_c$  and  $t_{sv}$ ) which are guaranteed at 100°C.

The Safe Operating Area figures shown in Figures 12 and 13 are specified for these devices under the test conditions shown.

FIGURE 12 — FORWARD BIAS SAFE OPERATING AREA

FIGURE 13 — REVERSE BIAS SAFE OPERATING AREA

FIGURE 14 — POWER DERATING

SAFE OPERATING AREA INFORMATION

FORWARD BIAS

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate  $I_C$ - $V_{CE}$  limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 12 is based on  $T_C = 25^\circ\text{C}$ ;  $T_J(\text{pk})$  is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be derated when  $T_C \geq 25^\circ\text{C}$ . Second breakdown limitations do not derate the same as thermal limitations. Allowable current at the voltages shown on Figure 12 may be found at any case temperature by using the appropriate curve on Figure 14.

$T_J(\text{pk})$  may be calculated from the data in Figure 11. At high case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown.

REVERSE BIAS

For inductive loads, high voltage and high current must be sustained simultaneously during turn-off, in most cases, with the base to emitter junction reverse biased. Under these conditions the collector voltage must be held to a safe level at or below a specific value of collector current. This can be accomplished by several means such as active clamping, RC snubbing, load line shaping, etc. The safe level for these devices is specified as Reverse Bias Safe Operating Area and represents the voltage-current conditions during reverse biased turn-off. This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode. Figure 13 gives RBSOA characteristics.
