

## 1 Mbit (128Kb x8) UV EPROM and OTP EPROM

- 5V ± 10% SUPPLY VOLTAGE in READ OPERATION
- FAST ACCESS TIME: 35ns
- LOW POWER CONSUMPTION:
  - Active Current 30mA at 5Mhz
  - Standby Current 100µA
- PROGRAMMING VOLTAGE: 12.75V ± 0.25V
- PROGRAMMING TIME: 100µs/byte (typical)
- ELECTRONIC SIGNATURE
  - Manufacturer Code: 20h
  - Device Code: 05h

### DESCRIPTION

The M27C1001 is a 1 Mbit EPROM offered in the two ranges UV (ultra violet erase) and OTP (one time programmable). It is ideally suited for micro-processor systems requiring large programs and is organized as 131,072 words of 8 bits.

The FDIP32W (window ceramic frit-seal package) and the LCCC32W (leadless chip carrier package) have a transparent lids which allow the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written to the device by following the programming procedure.

For applications where the content is programmed only one time and erasure is not required, the M27C1001 is offered in PDIP32, PLCC32 and TSOP32 (8 x 20 mm) packages.

DEVICE OPERATION

The operating modes of the M27C1001 are listed in the Operating Modes table. A single power supply is required in the read mode. All inputs are TTL levels except for VPP and 12V on A9 for Electronic Signature.

Read Mode

The M27C1001 has two control functions, both of which must be logically active in order to obtain data at the outputs. Chip Enable (E-bar) is the power control and should be used for device selection. Output Enable (G-bar) is the output control and should be used to gate data to the output pins, independent of device selection. Assuming that the addresses are stable, the address access time (tAVQV) is equal to the delay from E-bar to output (tELQV). Data is available at the output after a delay of tGLQV from the falling edge of G-bar, assuming that E-bar has been low and the addresses have been stable for at least tAVQV-tGLQV.

Standby Mode

The M27C1001 has a standby mode which reduces the supply current from 30mA to 100µA. The M27C1001 is placed in the standby mode by applying a CMOS high signal to the E-bar input. When in the standby mode, the outputs are in a high impedance state, independent of the G-bar input.

**Table 2. Absolute Maximum Ratings** <sup>(1)</sup>

Symbol	Parameter	Value	Unit
T <sub>A</sub>	Ambient Operating Temperature <sup>(3)</sup>	-40 to 125	°C
T <sub>BIAS</sub>	Temperature Under Bias	-50 to 125	°C
T <sub>STG</sub>	Storage Temperature	-65 to 150	°C
V <sub>IO</sub> <sup>(2)</sup>	Input or Output Voltages (except A9)	-2 to 7	V
V <sub>CC</sub>	Supply Voltage	-2 to 7	V
V <sub>A9</sub> <sup>(2)</sup>	A9 Voltage	-2 to 13.5	V
V <sub>PP</sub>	Program Supply Voltage	-2 to 14	V

**Notes:** 1. Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

2. Minimum DC voltage on Input or Output is -0.5V with possible undershoot to -2.0V for a period less than 20ns. Maximum DC voltage on Output is V<sub>CC</sub> +0.5V with possible overshoot to V<sub>CC</sub> +2V for a period less than 20ns.

3. Depends on range.

**Table 3. Operating Modes**

Mode	$\bar{E}$	$\bar{G}$	$\bar{P}$	A9	V <sub>PP</sub>	Q0 - Q7
Read	V <sub>IL</sub>	V <sub>IL</sub>	X	X	V <sub>CC</sub> or V <sub>SS</sub>	Data Out
Output Disable	V <sub>IL</sub>	V <sub>IH</sub>	X	X	V <sub>CC</sub> or V <sub>SS</sub>	Hi-Z

### Two Line Output Control

Because EPROMs are usually used in larger memory arrays, this product features a 2 line control function which accommodates the use of multiple memory connection. The two line control function allows :

- the lowest possible memory power dissipation,
- complete assurance that output bus contention will not occur.

For the most efficient use of these two control lines,  $\bar{E}$  should be decoded and used as the primary device selecting function, while  $\bar{G}$  should be made a common connection to all devices in the array and connected to the READ line from the system control bus. This ensures that all deselected memory devices are in their low power standby mode and that the output pins are only active when data is required from a particular memory device.

**Table 5. AC Measurement Conditions**

	High Speed	Standard
Input Rise and Fall Times	≤ 10ns	≤ 20ns
Input Pulse Voltages	0 to 3V	0.4V to 2.4V
Input and Output Timing Ref. Voltages	1.5V	0.8V and 2V

**Table 6. Capacitance<sup>(1)</sup> (T<sub>A</sub> = 25 °C, f = 1 MHz)**

Symbol	Parameter	Test Condition	Min	Max	Unit
C <sub>IN</sub>	Input Capacitance	V <sub>IN</sub> = 0V		6	pF
C <sub>OUT</sub>	Output Capacitance	V <sub>OUT</sub> = 0V		12	pF

Note: 1. Sampled only, not 100% tested.

**System Considerations**

The power switching characteristics of Advanced CMOS EPROMs require careful decoupling of the devices. The supply current, I<sub>CC</sub>, has three segments that are of interest to the system designer: the standby current level, the active current level, and transient current peaks that are produced by the falling and rising edges of  $\bar{E}$ . The magnitude of the transient current peaks is dependent on the capacitive and inductive loading of the device at the output.

The associated transient voltage peaks can be suppressed by complying with the two line output

control and by properly selected decoupling capacitors. It is recommended that a 0.1μF ceramic capacitor be used on every device between V<sub>CC</sub> and V<sub>SS</sub>. This should be a high frequency capacitor of low inherent inductance and should be placed as close to the device as possible. In addition, a 4.7μF bulk electrolytic capacitor should be used between V<sub>CC</sub> and V<sub>SS</sub> for every eight devices. The bulk capacitor should be located near the power supply connection point. The purpose of the bulk capacitor is to overcome the voltage drop caused by the inductive effects of PCB traces.

**Table 7. Read Mode DC Characteristics (1)**(T<sub>A</sub> = 0 to 70 °C, -40 to 85 °C or -40 to 125 °C; V<sub>CC</sub> = 5V ± 5% or 5V ± 10%; V<sub>PP</sub> = V<sub>CC</sub>)

Symbol	Parameter	Test Condition	Min	Max	Unit
I <sub>LI</sub>	Input Leakage Current	0V ≤ V <sub>IN</sub> ≤ V <sub>CC</sub>		±10	μA
I <sub>LO</sub>	Output Leakage Current	0V ≤ V <sub>OUT</sub> ≤ V <sub>CC</sub>		±10	μA
I <sub>CC</sub>	Supply Current	$\bar{E} = V_{IL}, \bar{G} = V_{IL}, I_{OUT} = 0mA, f = 5MHz$		30	mA
I <sub>CC1</sub>	Supply Current (Standby) TTL	$\bar{E} = V_{IH}$		1	mA
I <sub>CC2</sub>	Supply Current (Standby) CMOS	$\bar{E} > V_{CC} - 0.2V$		100	μA
I <sub>PP</sub>	Program Current	V <sub>PP</sub> = V <sub>CC</sub>		10	μA
V <sub>IL</sub>	Input Low Voltage		-0.3	0.8	V
V <sub>IH</sub> (2)	Input High Voltage		2	V <sub>CC</sub> + 1	V
V <sub>OL</sub>	Output Low Voltage	I <sub>OL</sub> = 2.1mA		0.4	V
V <sub>OH</sub>	Output High Voltage TTL	I <sub>OH</sub> = -400μA	2.4		V
	Output High Voltage CMOS	I <sub>OH</sub> = -100μA	V <sub>CC</sub> - 0.7		V

Note: 1. V<sub>CC</sub> must be applied simultaneously with or before V<sub>PP</sub> and removed simultaneously or after V<sub>PP</sub>.  
2. Maximum DC voltage on Output is V<sub>CC</sub> + 0.5V.

**Table 8A. Read Mode AC Characteristics (1)**(T<sub>A</sub> = 0 to 70 °C, -40 to 85 °C or -40 to 125 °C; V<sub>CC</sub> = 5V ± 5% or 5V ± 10%; V<sub>PP</sub> = V<sub>CC</sub>)

### Programming

When delivered (and after each erasure for UV EPROM), all bits of the M27C1001 are in the '1' state. Data is introduced by selectively programming '0's into the desired bit locations. Although only '0's will be programmed, both '1's and '0's can be present in the data word. The only way to

change a '0' to a '1' is by die exposition to ultraviolet light (UV EPROM). The M27C1001 is in the programming mode when  $V_{PP}$  input is at 12.75V,  $\bar{E}$  is at  $V_{IL}$  and  $\bar{P}$  is pulsed to  $V_{IL}$ . The data to be programmed is applied to 8 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL.  $V_{CC}$  is specified to be  $6.25V \pm 0.25V$ .

**Table 9. Programming Mode DC Characteristics <sup>(1)</sup>**(T<sub>A</sub> = 25 °C; V<sub>CC</sub> = 6.25V ± 0.25V; V<sub>PP</sub> = 12.75V ± 0.25V)

Figure 6. Programming and Verify Modes AC Waveforms

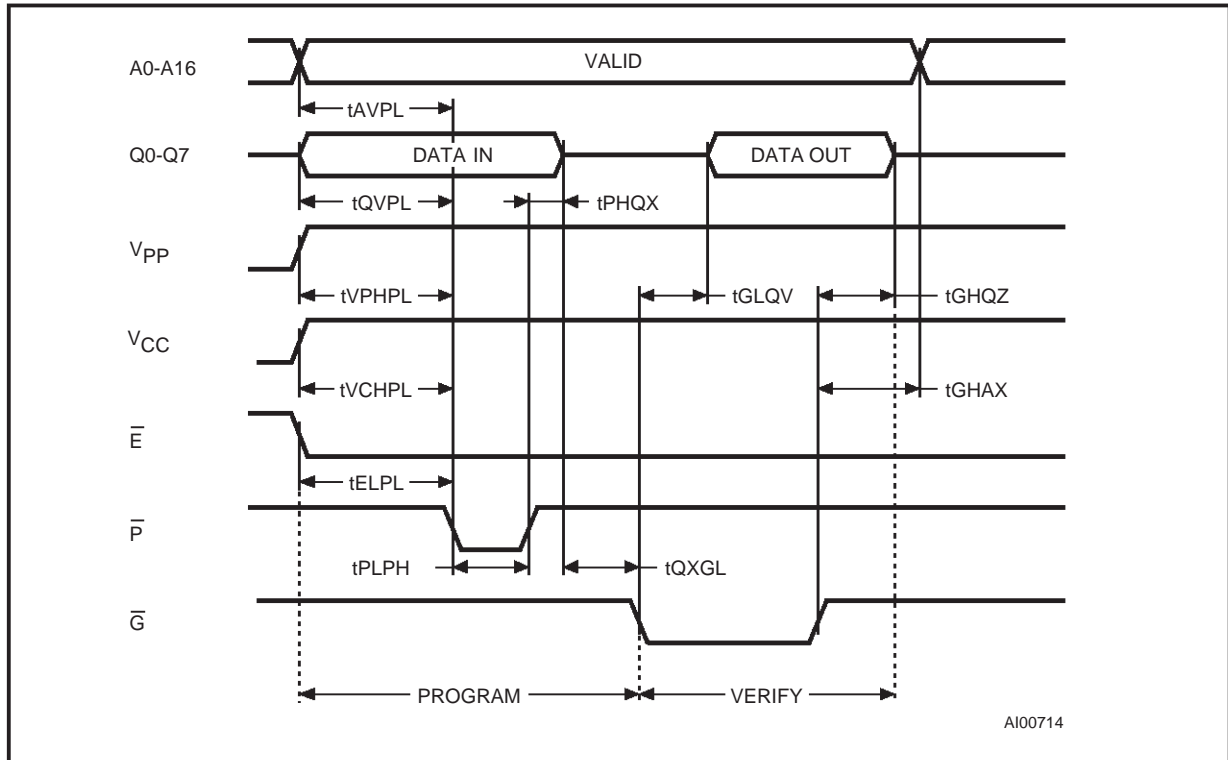

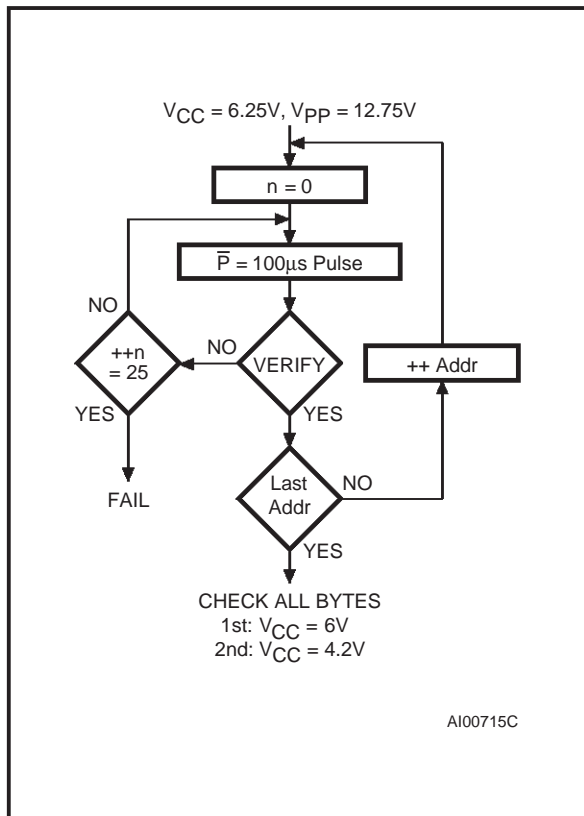

Figure 7. Programming Flowchart

**PRESTO II Programming Algorithm**

PRESTO II Programming Algorithm allows the whole array to be programmed, with a guaranteed margin, in a typical time of 13 seconds. Programming with PRESTO II involves in applying a sequence of 100µs program pulses to each byte until a correct verify occurs (see Figure 7). During programming and verify operation, a MARGIN MODE circuit is automatically activated in order to guarantee that each cell is programmed with enough margin. No overprogram pulse is applied since the verify in MARGIN MODE provides necessary margin to each programmed cell.

**Program Inhibit**

Programming of multiple M27C1001s in parallel with different data is also easily accomplished. Except for  $\bar{E}$ , all like inputs including  $\bar{G}$  of the parallel M27C1001 may be common. A TTL low level pulse applied to a M27C1001's  $\bar{P}$  input, with  $\bar{E}$  low and V<sub>PP</sub> at 12.75V, will program that M27C1001. A high level  $\bar{E}$  input inhibits the other M27C1001s from being programmed.

**Program Verify**

A verify (read) should be performed on the programmed bits to determine that they were correctly programmed. The verify is accomplished with  $\bar{E}$  and  $\bar{G}$  at V<sub>IL</sub>,  $\bar{P}$  at V<sub>IH</sub>, V<sub>PP</sub> at 12.75V and V<sub>CC</sub> at 6.25V.

### On-Board Programming

The M27C1001 can be directly programmed in the application circuit. See the relevant Application Note AN620.

### Electronic Signature

The Electronic Signature (ES) mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and type. This mode is intended for use by programming equipment to automatically match the device to be programmed with its corresponding programming algorithm. The ES mode is functional in the  $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$  ambient temperature range that is required when programming the M27C1001. To activate the ES mode, the programming equipment must force 11.5V to 12.5V on address line A9 of the M27C1001, with  $V_{PP}=V_{CC}=5\text{V}$ . Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from  $V_{IL}$  to  $V_{IH}$ . All other address lines must be held at  $V_{IL}$  during Electronic Signature mode.

Byte 0 ( $A0=V_{IL}$ ) represents the manufacturer code and byte 1 ( $A0=V_{IH}$ ) the device identifier code. For the STMicroelectronics M27C1001, these two identifier bytes are given in Table 4 and can be read-out on outputs Q0 to Q7.

### ERASURE OPERATION (applies to UV EPROM)

The erasure characteristics of the M27C1001 is such that erasure begins when the cells are exposed to light with wavelengths shorter than approximately 4000 Å. It should be noted that sunlight and some type of fluorescent lamps have wavelengths in the 3000-4000 Å range. Research shows that constant exposure to room level fluorescent lighting could erase a typical M27C1001 in about 3 years, while it would take approximately 1 week to cause erasure when exposed to direct sunlight. If the M27C1001 is to be exposed to these types of lighting conditions for extended periods of time, it is suggested that opaque labels be put over the M27C1001 window to prevent unintentional erasure. The recommended erasure procedure for the M27C1001 is exposure to short wave ultraviolet light which has a wavelength of 2537 Å. The integrated dose (i.e. UV intensity x exposure time) for erasure should be a minimum of 15 W-sec/cm<sup>2</sup>. The erasure time with this dosage is approximately 15 to 20 minutes using an ultraviolet lamp with 12000 μW/cm<sup>2</sup> power rating. The M27C1001 should be placed within 2.5 cm (1 inch) of the lamp tubes during the erasure. Some lamps have a filter on their tubes which should be removed before erasure.
