

TOSHIBA CMOS DIGITAL INTEGRATED CIRCUIT SILICON MONOLITHIC

**TC74VCX16601FT****LOW-VOLTAGE 18-BIT UNIVERSAL BUS TRANSCEIVER  
WITH 3.6 V TOLERANT INPUTS AND OUTPUTS**

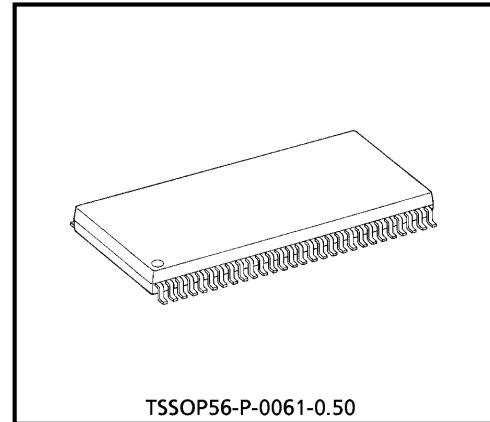

The TC74VCX16601FT is a high performance CMOS 18-bit UNIVERSAL BUS TRANSCEIVER. Designed for use in 1.8, 2.5 or 3.3 Volt systems, it achieves high speed operation while maintaining the CMOS low power dissipation.

It is also designed with over voltage tolerant inputs and outputs up to 3.6 V.

Data flow in each direction is controlled by output-enable ( $\overline{OEAB}$  and  $\overline{OEBA}$ ), latch-enable (LEAB and LEBA), and clock (CKAB and CKBA) inputs. The clock can be controlled by the clock-enable ( $\overline{CKENAB}$  and  $\overline{CKENBA}$ ) inputs. For A-to-B data flow, the device operates in the transparent mode when LEAB is high. When LEAB is low, the A data is latched if CKAB is held at a high or low logic level. If LEAB is low, the A-bus data is stored in the latch/flip-flop on the low-to-high transition of CKAB.

Data flow for B to A is similar to that of A to B but uses  $\overline{OEBA}$ , LEBA, CKBA, and  $\overline{CKENBA}$ . When the  $\overline{OE}$  input is high, the outputs are in a high impedance state. This device is designed to be used with 3-state memory address drivers, etc.

All inputs are equipped with protection circuits against static discharge.

- Power Down Protection is provided on all inputs and outputs.
- Supports live insertion / withdrawal (Note 3)

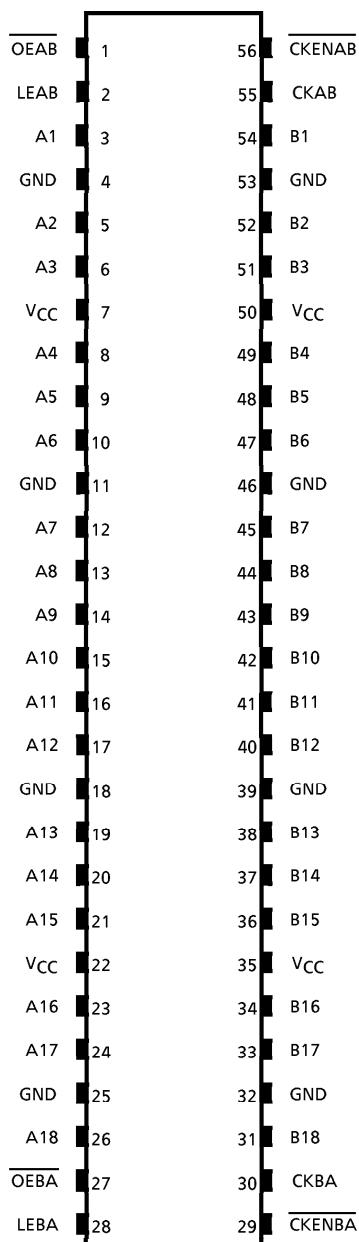

(Note 1) : Do not apply a signal to any bus terminal when it is in the output mode. Damage may result.

(Note 2) : All floating (high impedance) bus terminal must have their input level fixed by means of pull up or pull down resistors.

(Note 3) : To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.
