Read & Write Cycle (Same Bank) @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Single Bit Read-Write-Read Cycle (Same Page) @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

- *Notes:**
1. When $\overline{\text{CS}}$ is set "High" at a clock transition from "Low" to "High", all inputs except CKE, DQM0 - 3 are invalid.
 2. When issuing an active, read or write command, the bank is selected by BA0 and BA1.

BA1	BA0	Active, read or write
0	0	Bank A
0	1	Bank B
1	0	Bank C
1	1	Bank D

3. The auto precharge function is enabled or disabled by the A10 input when the read or write command is issued.

A10	BA1	BA0	Operation
0	0	0	After the end of burst, bank A holds the idle status.
1	0	0	After the end of burst, bank A is precharged automatically.
0	0	1	After the end of burst, bank B holds the idle status.
1	0	1	After the end of burst, bank B is precharged automatically.
0	1	0	After the end of burst, bank C holds the idle status.
1	1	0	After the end of burst, bank C is precharged automatically.
0	1	1	After the end of burst, bank D holds the idle status.
1	1	1	After the end of burst, bank D is precharged automatically.

4. When issuing a precharge command, the bank to be precharged is selected by the A10, BA1 and BA0 inputs.

A10	BA1	BA0	Operation
0	0	0	Bank A is precharged.
0	0	1	Bank B is precharged.
0	1	0	Bank C is precharged.
0	1	1	Bank D is precharged.
1	X	X	All banks are precharged.

5. The input data and the write command are latched by the same clock (Write latency = 0).
6. The output is forced to high impedance by (1 CLK + $t_{0\text{HZ}}$) after DQM0 - 3 entry.

Page Read & Write Cycle (Same Bank) @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

- *Notes:**
1. To write data before a burst read ends, DQM0 - 3 should be asserted three cycles prior to the write command, to avoid bus contention.
 2. To assert row precharge before a burst write ends, wait t_{WR} after the last write data input. Input data during the precharge input cycle will be masked internally.

Read & Write Cycle with Auto Precharge @ Burst Length = 4

Bank Interleave Random Row Write Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Bank Interleave Page Read Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Bank Interleave Page Write Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Bank Interleave Random Row Read/Write Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Bank Interleave Page Read/Write Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

Clock Suspension & DQM Operation Cycle @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

- *Notes:**
1. When CKE is deactivated, the next clock will be ignored.
 2. When DQM0 - 3 are asserted, the read data after two clock cycles will be masked.
 3. When DQM0 - 3 are asserted, the write data in the same clock cycles will be masked.
 4. When DQM0 is set High, the input/output data of DQ1 - DQ8 will be masked.
When DQM1 is set High, the input/output data of DQ9 - DQ16 will be masked.
When DQM2 is set High, the input/output data of DQ17 - DQ24 will be masked.
When DQM3 is set High, the input/output data of DQ25 - DQ32 will be masked.

Read Interruption by Precharge Command @ Burst Length = 8

***Note:** 1. If row precharge is asserted before burst read ends, then the read data will not output after the second clock cycle of the precharge command.

Power Down Mode @ $\overline{\text{CAS}}$ Latency = 2, Burst Length = 4

- *Notes:**
1. When all banks are in precharge state, and if CKE is set low, then the MD56V62320 enters power-down mode and maintains the mode while CKE is low.
 2. To release the circuit from power-down mode, CKE has to be set high for longer than t_{PDE} ($t_{\text{SI}} + 1 \text{ CLK}$).
