## FEATURES

- Complies with Universal Serial Bus specification 1.1
- Utilizes digital inputs and outputs to transmit and receive USB cable data
- Supports 12Mbit/s "Full Speed" and 1.5Mbit/s "Low Speed" serial data transmission
- Compatible with the VHDL "Serial Interface Engine" from USB Implementers' Forum
- Supports single-ended data interface
- Single 3.3V supply
- Available in SO-14, SSOP-14 and TSSOP-14 packages

## DESCRIPTION

The PDIUSBP11A is a one chip generic USB transceiver. It is designed to allow 5.0V or 3.3V programmable and standard logic to interface with the physical layer of the Universal Serial Bus. It is capable of transmitting and receiving serial data at both full speed (12Mbit/s) and low speed (1.5Mbit/s) data rates.

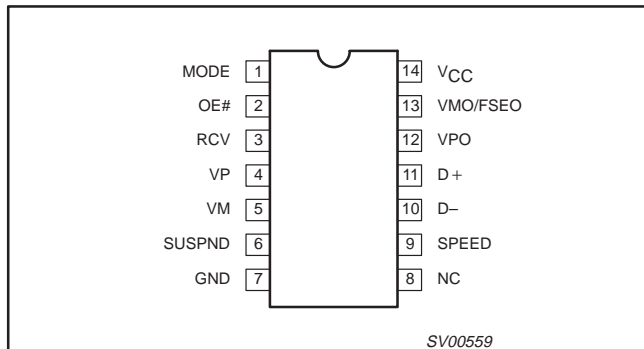

The pinout conforms with the "Serial Interface Engine". Implementation of the Serial Interface Engine along with the USB transceiver allows the designer to make USB compatible devices with off-the-shelf logic and easily modify and update the application.

The PDIUSBP11A is backward compatible to the PDIUSBP11 and allows for single-ended data interfacing.

## PIN DESCRIPTION

PIN No.	PIN SYMBOL	I/O	NAME AND FUNCTION																														
3	RCV	O	Receive data. CMOS level output for USB differential input																														
2	OE#	I	Output Enable. Active LOW, enables the transceiver to transmit data on the bus. When not active the transceiver is in receive mode																														
1	MODE	I	Mode. When left unconnected, a weak pull-up transistor pulls it to $V_{CC}$ and in this mode, the PDIUSBP11A is backward compatible to PDIUSBP11. When connected to GND, the VMO/FSEO pin takes the function of FSEO (Force SEO).
