

TOSHIBA Bi-CMOS INTEGRATED CIRCUIT SILICON MONOLITHIC

T B 6 2 7 2 6 A N, T B 6 2 7 2 6 A F

16-bit constant current LED driver with operation supply of 3.3V to 5V

The TB62726A series are comprised of constant-current drivers designed for LEDs and LED displays. The output current value can be set using an external resistor. As a result, all outputs will have virtually the same current levels. This driver incorporates 16-bit constant-current outputs, a 16-bit shift register, a 16-bit latch and 16-bit AND-gate circuit. These drivers have been designed using the Bi-CMOS process.

Feature

- *Output current capability and the number of output:
90 mA x 16 outputs
- *Constant current range : 2 to 90 mA
- *Application output voltage :
0.7V (output current 2 to 80mA)
0.4V (output current 2 to 40mA)
- *For anode common LED
- *Input signal voltage level :
3.3V-5.0V CMOS level (schmitt trigger input)
- *Power supply voltage range VDD=3.0 to 5.5V
- *Maximum output terminal voltage 17V
- *Serial and parallel data transfer rate 20 MHz (min., Cascade Connection)
- *Operation temperature range top_r = -40 to 85 degrees
- *Package : AN type - - - P-SDIP-300-1.78
AF type - - - P-SSOP24-300-1.00B
- *Current accuracy (not used dot-current correction.)

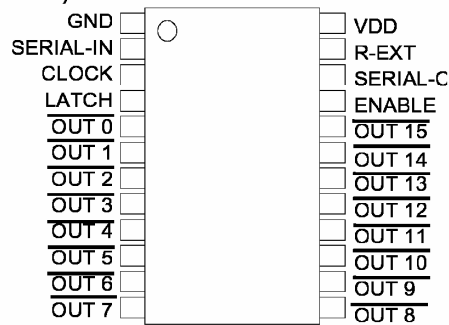

Output voltage	Current accuracy		Output current
	between bits	between ICs	
>= 0.4V	+/- 4 %	+/- 12 %	2 to 40 mA
>= 0.7V			2 to 90 mA

Package and pin layout (Top view)

Warnings : Short-circuiting an output terminal to GND or to the power supply terminal may broken the device.
Please take care when wiring the output terminals, the power supply terminal and the GND terminals.

Block Diagram

Truth Table

CLOCK	LATCH	ENABLE	SERIAL-IN	OUT0 --- OUT7 --- OUT15	SERIAL-OUT
Positive edge	H	L	Dn	Dn --- Dn-7 --- Dn-15	Dn-15
Positive edge	L	L	Dn+1	No Change	Dn-14
Positive edge	H	L	Dn+2	Dn+2 --- Dn-5 --- Dn-13	Dn-13
Negative edge	X	L	Dn+3	Dn+2 --- Dn-5 --- Dn-13	Dn-13
Negative edge	X	H	Dn+3	Off	Dn-13

Note 1: OUT0~OUT15=ON when Dn=H ; OUT0~OUT15=OFF when Dn=L

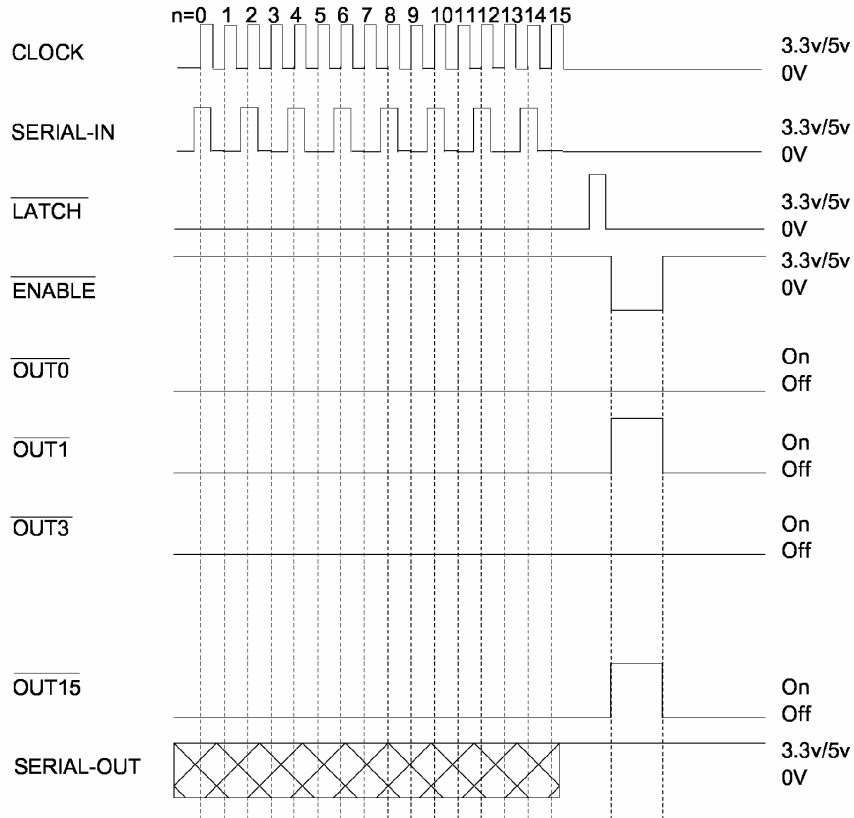

In order to ensure that the level of the power supply voltage is correct, an external resistor have to connected between R-EXT and GND.

Timing diagram

Warning :

Latch circuit is leveled-latch circuit. Be careful because it is not triggered-latch circuit.

Note 2 :

The latches circuit holds data by pulling the LATCH terminal Low. And, when LATCH terminal is a High-level, latch circuit doesn't hold data, and it passes from the input to the output. When ENABLE terminal is Low-level, output terminal OUT0~OUT15 respond to the data, and on & off does.

And, when ENABLE terminal is a High-level, it offs with the output terminal regardless of the data.

Terminal description

Pin No.	Pin Name	Function
1	GND	GND terminal for control logic
2	SERIAL-IN	Input terminal for serial data for data shift register
3	CLOCK	Input terminal for clock for data shift on rising edge
4	$\overline{\text{LATCH}}$	Input terminal for data strobe When the LATCH=High-level, data is no latched. When the LATCH=Low-level, data is latched.
5 ~ 20	$\overline{\text{OUT 0 ~ 15}}$	Constant-current output terminals
21	$\overline{\text{ENABLE}}$	Input terminal for output enable. All outputs (OUT0 ~ OUT15) are turned off, when the ENABLE=High-level. And are turned on, when the ENABLE=Low-level.
22	SERIAL-OUT	Output terminal for serial data input on SERIAL-IN terminal
23	R-EXT	Input terminal used to connect an external resistor. This regulated the output current.
24	VDD	3.3V - 5V supply voltage terminal.

Application circuit (example 1) : The general composition in static lighting of LED.

More than $V_{LED}(V) \geq V_f(\text{total max.}) + 0.7$ is recommended with the following application circuit with the LED power supply V_{LED} .
 r1: The setup resistance for the setup of output current of every IC.
 r2: The variable resistance for the brightness control of every LED module.

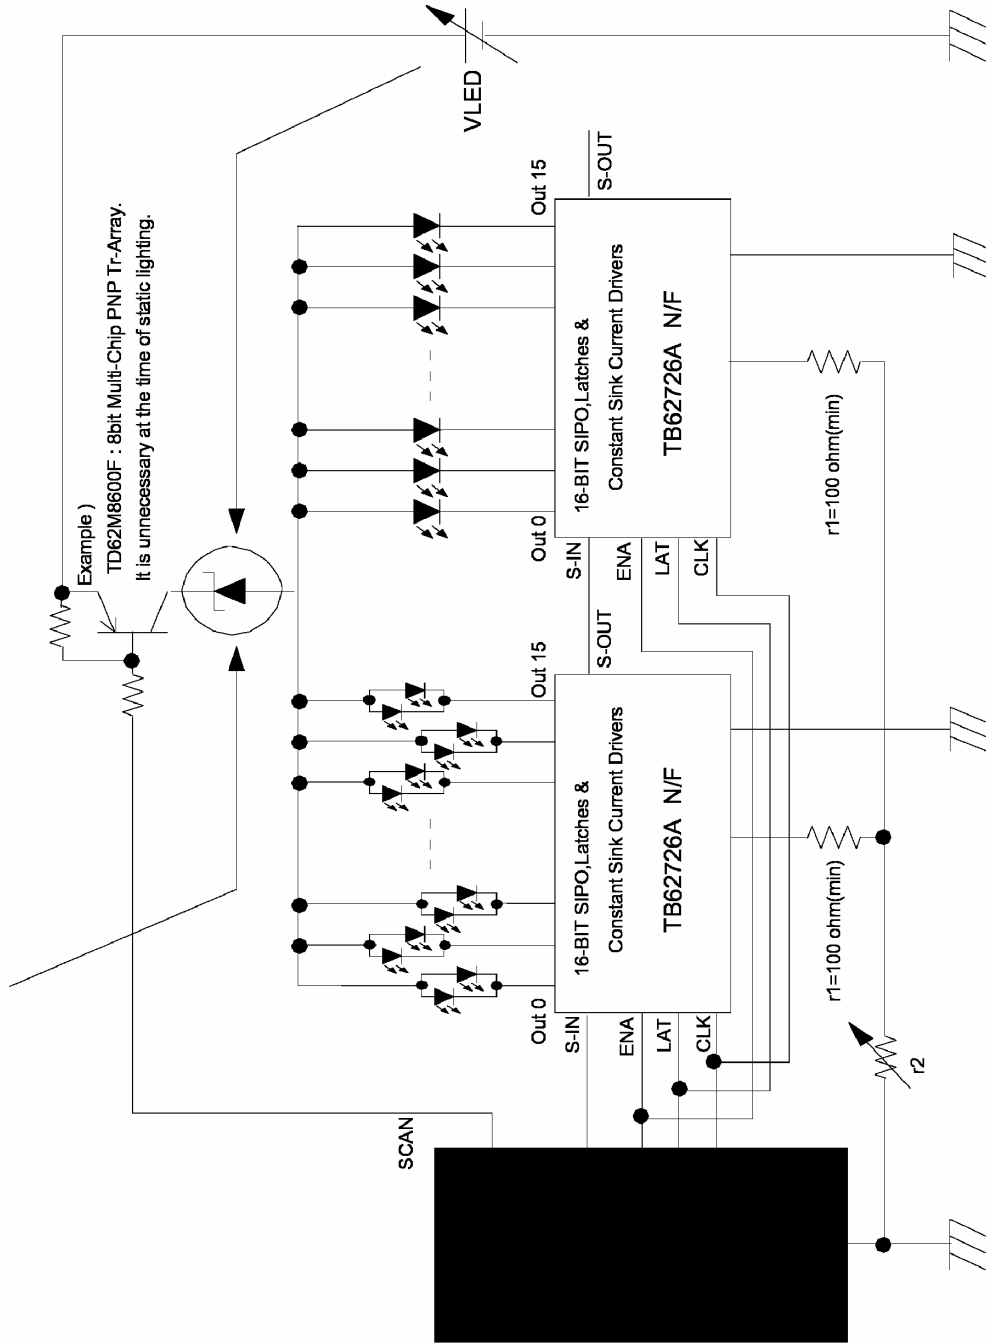

Corporate Headquarters
 120 Broadway · Menands NY 12204

Application circuit (example 2) : When the condition of VLED is $VLED > 17V$.

The unnecessary voltage is one effective technique as to making the voltage descend with the zenor diode.

Corporate Headquarters
 120 Broadway · Menands NY 12204
 Ph: 518.432.7424 · Fax: 518.432.7454

Email: info@marktechopto.com
 Website: www.marktechopto.com

Application circuit (example 3) : When the condition of VLED is $V_f + 0.7 < V_{LED} < 17V$.

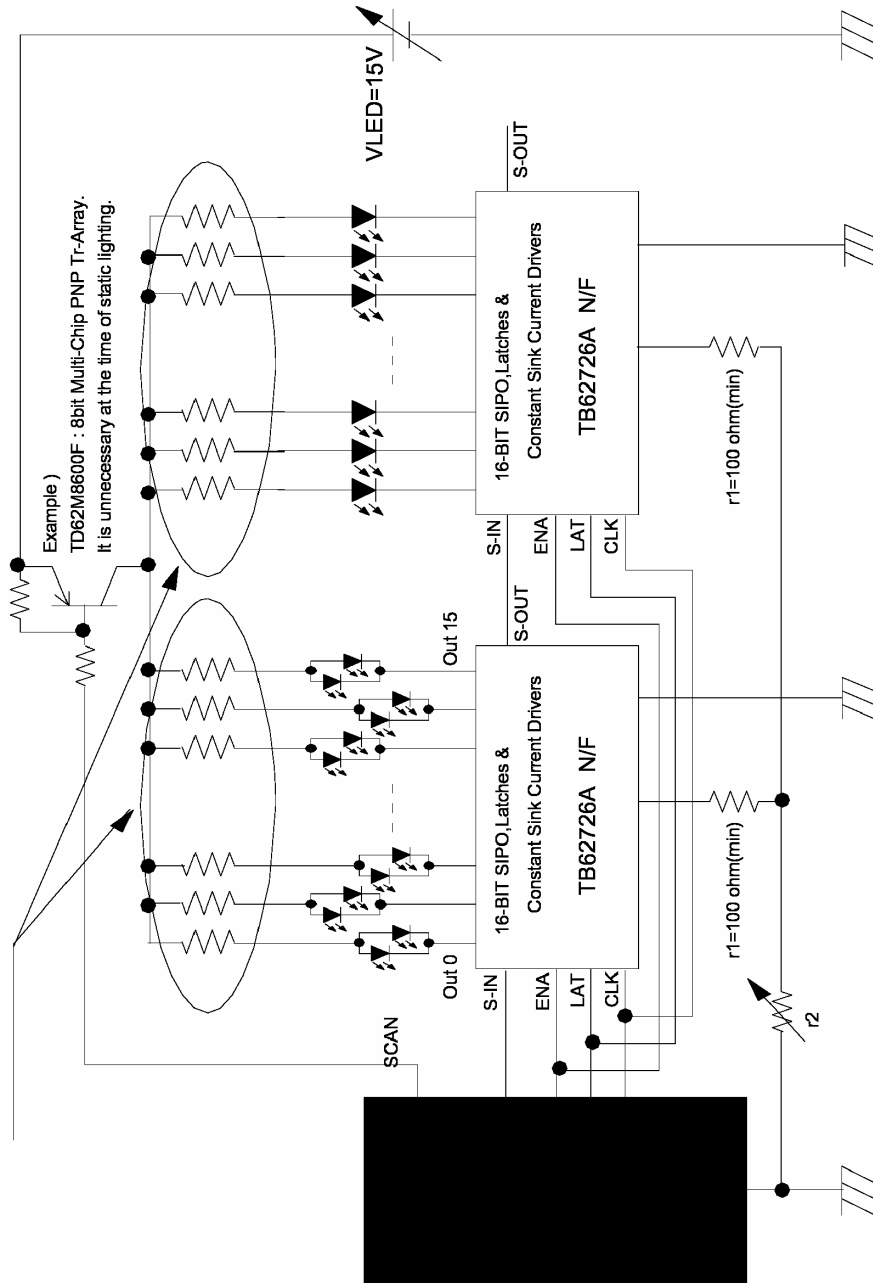

$V_{OUT} = V_{LED} - V_f = 0.7 \sim 1.0V$ is the most suitable for VOUT.

Surplus VOUT causes an IC fever and the useless consumption electric power.

It is the one way of being effective to build in the $r3$ in this problem.

$r3$ can make a calculation to the formula $r3 \text{ (ohms)} = \text{surplus } V_{OUT} / I_{OUT}$.

Though the resistance parts increase, the fixed constant current performance is kept.

 Website: www.marktechopto.com

Note:

Operating is likely to become unstable due to the electromagnetic guidance of wiring and so on.

Recommend that it adjoins it and it is arranged so far as device and LED are possible.

Damage by the over-voltage is likely to be suffered in LED and the output by over-voltage's occurring due to the inductance between LEDs from the output terminal.

There is only one GND terminal in this device. When the inductance of the GND line, resistance element, and so on are big, it is likely to operate

faultily by the GND noise when output switchings by the circuit board pattern and wiring.

And, it is necessary for the REXT terminal to connect it in the GND line which became stable through the resistor.

Vibration is likely to occur for the output wave form when GND was unstable and capacity (beyond 50pF) was added.

Therefore, be fully careful of the circuit board pattern layout and wiring from the controller.

This application circuit is a reference example, and it doesn't assure operating in all the conditions.

Be sure to carry out operating confirmation.

This device doesn't build in the protection circuit of over-voltage, over-current and over-temperature.

Carry it out on the control side when protection is necessary.

Device is likely to destroy it when it short-circuits between the output terminals to each power supply.

Be fully careful of output terminal, each power supply (VDD, VLED) and the design of the GND line.
