Military 5.0V pASIC 1 Family - Very-High-Speed CMOS FPGA

DEVICE HIGHLIGHTS

Very High Speed

- ViaLink“ metal-to-metal programmable technology, allows counter speeds over 150 MHz and logic cell delays of under 2 ns at 5V, and over 80 MHz at 3.3V operation.

High Usable Density

- Up to a 24-by-32 array of 768 logic cells provides 22,000 usable PLD gates in 208-pin PQFP and 208-pin CQFP packages.

PCI-Output Drive

- Fully PCI 2.1 compliant input/output capability. (including drive current)

FEATURES

- Total of 180 I/O pins
  - -172 Bidirectional Input/Output pins
  - -6 Dedicated Input/High-Drive pins
  - -2 Clock/Dedicated input pins with fanout-independent, low-skew clock networks
  - -PCI 2.1 Compliant I/Os
- Input + logic cell + output delays under 6 ns
- Chip-to-chip operating frequencies up to 110 MHz
- Internal state machine frequencies up to 150 MHz
- Clock skew < 0.5 ns
- Input hysteresis provides high noise immunity
- Built-in scan path permits 100% factory testing of logic and I/O cells and functional testing with Automatic Test Vector Generation (ATVG) software after programming
- 208 pin PQFP pin for pin compatible with the 208 CQFP
- 0.65µ CMOS process with ViaLink programming technology

QUICKLOGIC

Product Summary

The pASIC 1 Family is a very-high-speed CMOS user-programmable ASIC devices. The 768 logic cell field-programmable gate array (FPGA) features 22,000 usable PLD gates of high-performance general-purpose logic in a 208-pin PQFP and CQFP package.

Low-impedance, metal-to-metal, ViaLink interconnect technology provides nonvolatile custom logic capable of operating above 150 MHz. Logic cell delays under 2 ns, combined with input delays of under 1.5 ns and output delays under 3 ns, permit high-density programmable devices to be used with today's fastest microprocessors and DSPs.

Designs can be entered using QuickLogic's QuickWorks Toolkit or most popular third-party CAE tools. QuickWorks combines Verilog/VHDL design entry and simulation tools with device-specific place & route and programming software. Ample on-chip routing channels allow fast, fully automatic place and route of designs using up to 100% of the logic and I/O cells, while maintaining fixed pin-outs.

Notes:

[1] Capacitance is sample tested only. CI = 20 pF max on I/(SI).

[2] Only one output at a time. Duration should not exceed 30 seconds.

[3] Maximum Icc for military grade is 20 mA. For AC conditions use the formula described in the databook, Section 9 - Power vs Operating Frequency.

[4] Stated timing for worst case Propagation Delay over process variation at VCC = 5.0V and TA = 25°C. Multiply by the appropriate Delay Factor, K, for speed grade, voltage and temperature settings as specified in the Operating Range.

[5] These limits are derived from a representative selection of the slowest paths through the pASIC logic cell including net delays. Worst case delay values for specific paths should be determined from timing analysis of your particular design.

AC Performance

Propagation delays depend on routing, fanout, load capacitance, supply voltage, junction temperature, and process variation. The AC Characteristics are a design guide to provide initial timing estimates at nominal conditions. Worst case estimates are obtained when nominal propagation delays are multiplied by the appropriate Delay Factor, K, as specified in the Delay Factor table (Operating Range). The effects of voltage and temperature variation are illustrated in the graphs on the following pages, K Factor versus Voltage and Temperature. The pASIC Development Tools incorporate data sheet AC Characteristics into the QDIF database for pre-place-and-route timing analysis. The SpDE Delay Modeler extracts specific timing parameters for precise path analysis or simulation results following place and route.
