## BI-DIRECTIONAL MOTOR DRIVER

### BI-DIRECTIONAL MOTOR DRIVER

The Fujitsu MB3854 is a low voltage motor driver with forward/reverse control capability for motors such as those in auto focus film advancing mechanism, in front loading camera mechanisms, in CD player, and others driven by TTL-level signals.

The MB3854 has 300 mA drive units and brake capability for stop with TTL control input.

- Motor drive current: 300 mA max.
- Low power supply voltage operation 23V to 10V
- TTL-control capability
- Standby capability when input is off
- Brake capability at motor stop mode
- Built-in diode for surge absorption
- Plastic 8-pin dual in-line package (Suffix: -P)
- Plastic 8-pin flat package (Suffix: -PF)

### ABSOLUTE MAXIMUM RATINGS (see Note)

Rating	Symbol	Value	Unit
Power Supply Voltage	V <sub>CC</sub>	12	V
Output Current	I <sub>O</sub>	330(550) <sup>1</sup>	mA
Maximum Output Current	I <sub>O</sub> MAX <sup>2</sup>	0.8	mA
Power Dissipation	P <sub>D</sub>	560 <sup>3</sup>	A
Operating Temperature	T <sub>A</sub>	-20 to +75	°C
Storage Temperature	T <sub>STG</sub>	-55 to +125	°C

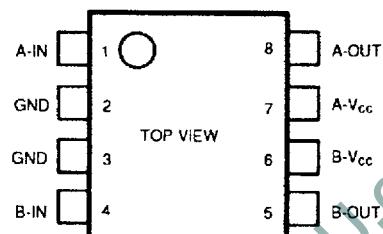

<sup>1</sup> I<sub>ON</sub> ≤ 1 sec, Duty = 50%

<sup>2</sup> t ≤ 5 ms

<sup>3</sup> T<sub>A</sub> ≤ 60°C

**Note :** Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### PIN ASSIGNMENT

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## FUNCTIONAL DESCRIPTIONS

In Control mode, output transistors shown in Figure 2 work as follows.

- FORWARD/REVERSE mode

According to the control B/C mode, transistor pairs 02-03 and 01-04 work alternately and exchange the supply current to the motor. When mode B is selected, 02 and 03 are active; A-OUT is at low level and B-OUT is at high level, current flows from B-OUT to A-OUT through the motor.

On the other hand, when the mode C is selected, the current flows in reverse direction.

- BRAKE mode

When control mode A is selected, 01 and 03 are inactive, 02 and 04 are active. A-OUT and B-OUT are clamped at low level, terminals of the motor are shorted and the motor is forced to stop.

- STANDBY mode

When stand-by mode is selected, all transistors are inactive and current does not flow through the motor. In this case, the supply current is less than 100 pA.

Table 1. Mode Table

Mode	Input Mode		Output Mode		Operation
	A-IN	B-IN	A-OUT	B-OUT	
A	1	1	L	L	Shot (Brake)
B	1	0	L	H	Forward
C	0	1	H	L	Reverse
D	0	0	--	--	Open (Stand-by)

Input mode 1:  $\geq 2.1V$   
2:  $\leq 0.4V$

## RECOMMENDED OPERATING CONDITIONS

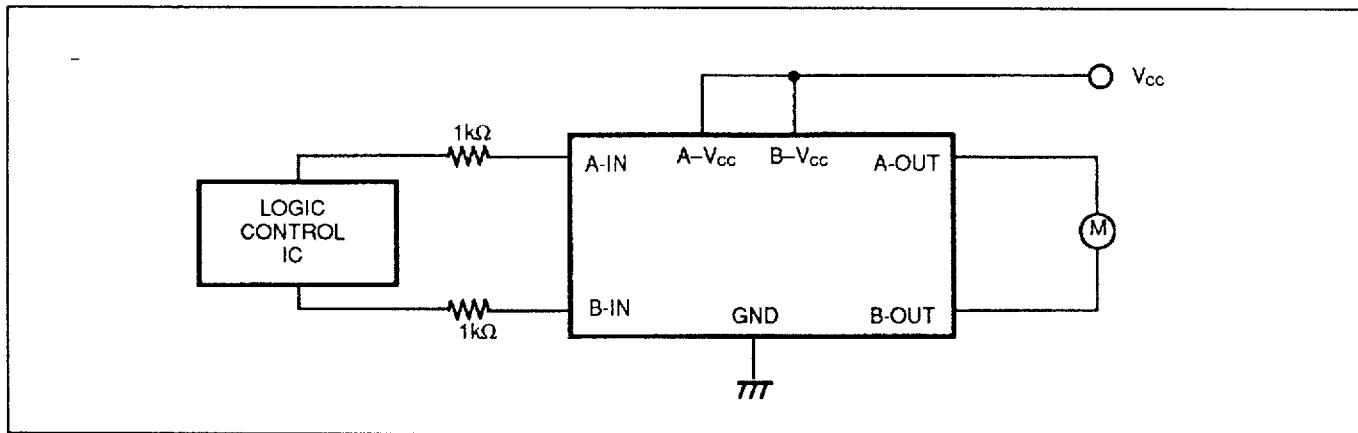

Parameter	Symbol	Value	Unit
Power Supply Voltage	V <sub>CC</sub>	2.3 to 10	V
Output Current	I <sub>O</sub>	0 to 300 (500 <sup>1</sup> )	mA
Input High Voltage	V <sub>IH</sub>	2.1 to V <sub>CC</sub> +0.3 <sup>2</sup>	V
Input Low Voltage	V <sub>IL</sub>	0 to 0.4	V

<sup>1</sup> t<sub>ON</sub> ≤ 1 sec, duty = 50%<sup>2</sup> When V<sub>IH</sub> ≥ V<sub>CC</sub>, I<sub>IH</sub> ≤ V<sub>CC</sub> × 0.2 mA

## ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = 3V, V<sub>IH</sub> = 2.4V, I<sub>O</sub> = 300 mA, T<sub>A</sub> = 25°C)

Parameter	Symbol	Condition	Value			Unit
			Min	Typ	Max	
Stand-by Current	I <sub>CC0</sub>	V <sub>CC</sub> = 6V, V <sub>IA</sub> = V <sub>IB</sub> = 0V			100	μA
Power Supply Current	I <sub>CC1</sub>	I <sub>O</sub> = 0 mA		4.5	8	mA
	I <sub>CC2</sub>	I <sub>O</sub> = 300 mA		24		
	I <sub>CC3</sub>	I <sub>O</sub> = 0 mA, V <sub>IA</sub> = V <sub>IB</sub> = 2.4V		7		
Output High Voltage	V <sub>OH</sub>		1.85	2.1		V
Output Low Voltage	V <sub>OL</sub>			0.25	0.35	V
Output Saturation Voltage	V <sub>SAT</sub>			1.15	1.5	V
Input Current	I <sub>IH</sub>	V <sub>IN</sub> = 2.4V		250	400	μA

**Note:** If the control voltage is input when the power supply voltage is not applied because of the time lag between those two voltages, excess current flows into IC from the input terminals. In this case, connect a resistor ( $\geq 1\text{ k}\Omega$ ) serially to input pin in order to prevent excess current flow.
