## RF Power Amplifier IC

## Designing with the MAAPSS0093

The MAAPSS0093 is built using a near-enhancement mode FET that operates from a single supply voltage. A negative voltage is not required because the FET is designed to operate with a +0V DC gate bias.

There is no impedance matching or RF choking on this IC - these functions are supplied externally. This approach offers the highest level of performance, the lowest bill of materials cost, and far fewer components than a discrete design.

To duplicate MAAPSS0093 data sheet performance, your circuit board must recreate the same impedances developed on this evaluation board. The table below has one-port s-parameter measurements looking into the traces on the evaluation board. S-parameters of the MAAPSS0093 are not supplied because the device is designed to operate under large-signal conditions.
