

1.2V to 3.6V Universal Bi-directional Level Shifter with Automatic Direction Control & Advanced Package Solution

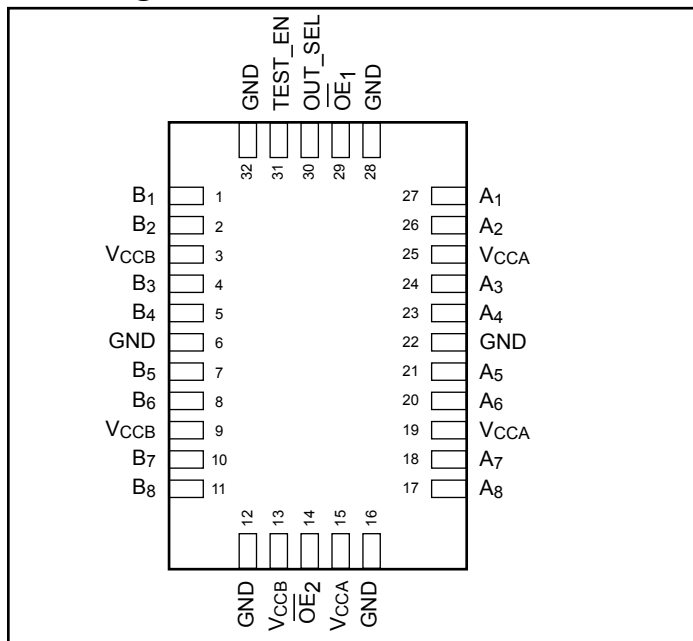

Features

- PI4ULS3V08M is designed for low voltage operation: 1.2V to 3.6V
- Universal bidirectional level shifting with automatic direction control
- Fast bus speeds up to 160 Mbps
- I_{OFF} supports partial Power-Down mode operation
- Drive Capability 12mA
- Independent translation of each bit
- Each supply rail is configurable over supply range
- ESD Protection exceeds JESD22
 - 2000V Human Body Model (A114-B)
 - 200V Machine Model (A115-A)
- Latch-up performance exceeds 100mA per JESD 78
- Industrial operation at –40°C to +85°C
- Packaging (Pb-free & Green):
 - 32-contact TQFN (ZL)

Applications

- Voltage Translation
- Bus Relay
- Mobile Devices

Pin Configuration

Description

PI4ULS3V08M, is a 8-bit (octal) non-inverting bus transceiver with two separate supply rails: A port (V_{CCA}) and B port (V_{CCB}) are set to operate at 1.2V to 3.6V. This arrangement permits universal bidirectional translation of differential signal levels over the voltage ranges.

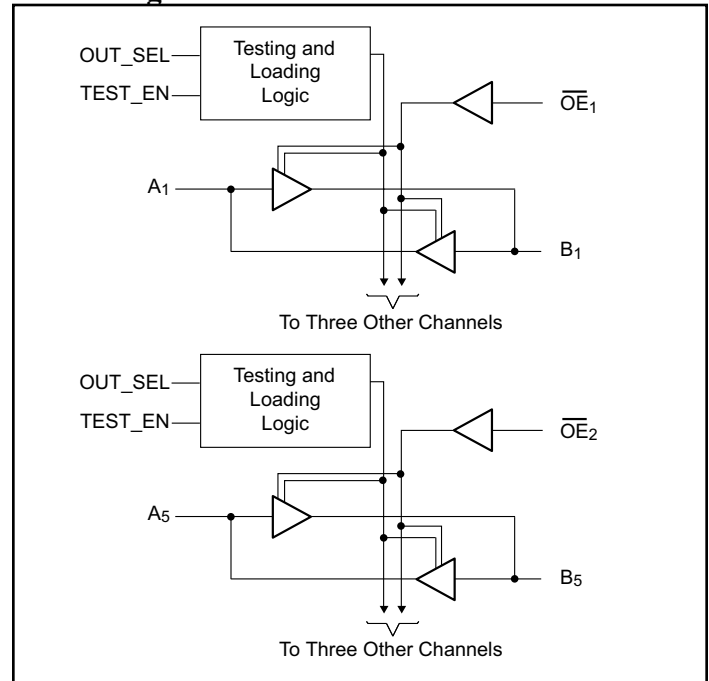

The PI4ULS3V08M is designed for asynchronous communication between data buses. Data is transmitted from the A bus to the B bus, or vice versa, without direction control. All A_X and B_X are tri-stated when data is coming from both directions at the same time. The output-enable (OE) input is used to disable outputs so buses are isolated.

The control pins, OE₁, TEST_EN and OUT_SEL are supplied by V_{CCB}.

The device is fully specified for partial-power-down applications using I_{OFF}. The I_{OFF} circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

To ensure the high impedance state during power-up or power-down, the output-enable (OE₁) input should be tied to V_{CC} through a pullup resistor: the minimum value of the resistor is determined by the current-sinking capability of the driver.

Note:

1. The input negative voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
2. This value is limited to 3.6V maximum.
3. Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Figure 1. Load Circuit and Voltage Waveforms

Notes:

- C_L includes probe and jig capacitance.
- All input pulses are supplied by generators having the following characteristics: $PRR \leq 10\text{Mz}$, $Z_O = 50\Omega$, $t_r \leq 2.5\text{ns}$, $t_f \leq 2.5\text{ns}$.
- The outputs are measured one at a time with one transition per measurement.
- V_{CCI} defines the input port (V_{CCA} or V_{CCB}).
- V_{CCO} defines the output port (V_{CCA} or V_{CCB}).
