

AMC8878/8879

Low Noise 150mA Low Dropout Regulator

DESCRIPTION

The AMC8878/8879 series is a low noise, low dropout linear regulator operating from 2.5V to 6.5V input. An external capacitor can be connected to the bypass pin to lower the output noise level to 30 μ V_{RMS}.

Designed with a P-channel MOSFET output transistor, the AMC8878/8879 consume a low supply current, independent of the load current and dropout voltage. The internal thermal shut down circuit will limit the junction temperature to below 150°C. Other features include thermal protection, reverse battery protection and output current limit. Both AMC8878 and AMC8879 come in a miniature 5-pin SOT-23 package.

FEATURES

- Low output noise: 30 μ V_{RMS}
- Industry standard '2982 pin assignment (AMC8878)

- On/Off control
- Low I_Q: 1.6 μ A
- Short circuit protection
- Internal thermal overload protection
- Available in surface mount 5-pin SOT-23 package.

TYPICAL APPLICATION

ABSOLUTE MAXIMUM RATINGS (Note)

Input Voltage, V _{IN}	12V
Operating Junction Temperature, T _J	150 °C
Storage Temperature Range	-65 °C to +150 °C
Lead Temperature (soldering, 10 seconds)	+260 °C
Power Dissipation, P _D @ T _A = 70 °C	150 mW

Note: Exceeding these ratings could cause damage to the device. All voltages are with respect to Ground. Currents are positive into, negative out of the specified terminal.

THERMAL DATA

DB PACKAGE:

Thermal Resistance from Junction to Ambient, θ _{JA}	220 °C /W
--	-----------

Junction Temperature Calculation: T_J = T_A + (P_D × θ_{JA}).

The θ_{JA} numbers are guidelines for the thermal performance of the device/pc-board system.

Connect the ground pin to ground using a large pad or ground plane for better heat dissipation.

All of the above assume no ambient airflow.

Maximum Power Calculation:

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_{A(MAX)}}{\theta_{JA}}$$

T_J(°C): Maximum recommended junction temperature

T_A(°C): Ambient temperature of the application

θ_{JA}(°C /W): Junction-to-junction temperature thermal resistance of the package, and other heat dissipating materials.

The maximum power dissipation for a single-output regulator is :

$$P_{D(MAX)} = [(V_{IN(MAX)} - V_{OUT(NOM)})] \times I_{OUT(NOM)} + V_{IN(MAX)} \times I_Q$$

Where: V_{OUT(NOM)} = the nominal output voltage

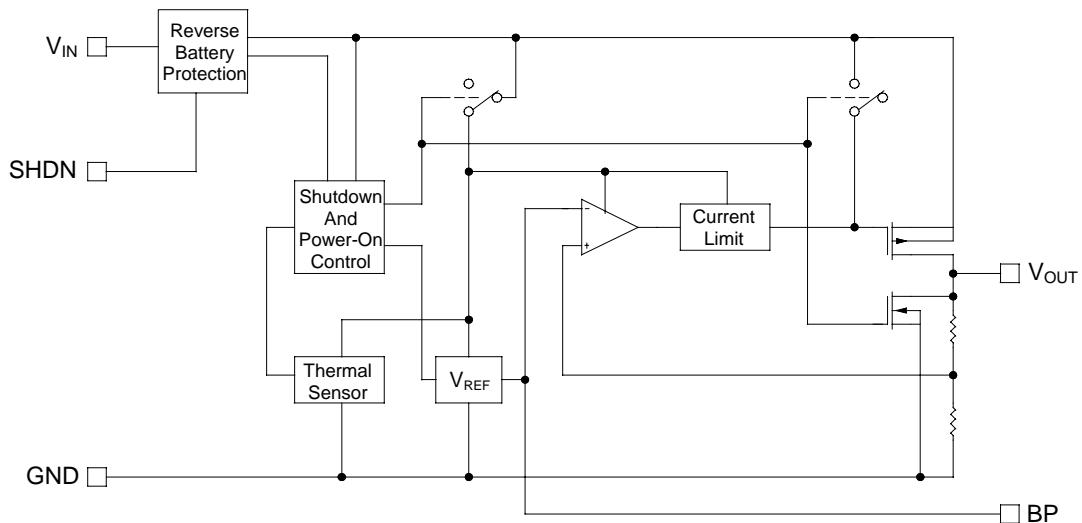

I_{OUT(NOM)} = the nominal output current, and

I_Q = the quiescent current the regulator consumes at I_{OUT(MAX)}

V_{IN(MAX)} = the maximum input voltage

Then θ_{JA} = (+150 °C - T_A) / P_D
