### DESCRIPTION

The AZ10/100EL32 is an integrated ÷2 divider. The reset pin is asynchronous and is asserted on the rising edge. Upon power-up, the internal flip-flop will attain a random logic state; the reset allows for the synchronization of multiple EL32's in a system.

The EL32 provides a  $V_{BB}$  output for single-ended use or a DC bias reference for AC coupling to the device. For single-ended input applications, the  $V_{BB}$  reference should be connected to one side of the CLK/CLK differential input pair. The input signal is then fed to the other CLK/CLK input. The  $V_{BB}$  pin should be used only as a bias for the EL32 as its sink/source capability is limited. When used, the  $V_{BB}$  pin should be bypassed to ground via a 0.01μF capacitor.

NOTE: Specifications in ECL/PECL tables are valid when thermal equilibrium is established.

### PIN DESCRIPTION

- $V_{\text{PP}}$  is the minimum peak-to-peak differential input swing for which AC parameters are guaranteed.
- $V_{\text{CMR}}$  is defined as the range within which the  $V_{\text{IH}}$  level may vary, with the device still meeting the propagation delay specification. The  $V_{\text{IL}}$  level must be such that the peak-to-peak voltage is less than 1.0V and greater than or equal to  $V_{\text{PP}}(\text{min})$ .
