Ultra Small SOT26 Package

General Description

The HMC323 is a GaAs InGaP Heterojunction Bipolar Transistor (HBT) MMIC amplifier that operates from a single Vcc supply. The surface mount SOT26 amplifier can be used as a broad-band gain stage or used with external matching for optimized narrow band applications. The HMC323 offers 13 dB of gain and +19 dBm of saturated power while only requiring 57 mA from a 8.75V supply. Using a Darlington feedback pair results in reduced sensitivity to normal process variations and provides a good 50-ohm input/output port match. This amplifier is ideal for RF systems where high linearity is required such as 2.2 - 2.7 GHz MMDS.

Evaluation PCB for HMC323

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown above. A sufficient number of VIA holes should be used to connect the top and bottom ground planes. The evaluation circuit board as shown is available from Hittite upon request.
