

FEATURES

- Operates with 3.3 V supply
- Interoperable with 5 V logic
- EIA RS-422 and RS-485 compliant over full CM range
- Data rate: 250 kbps
- Half duplex transceiver
- Reduced slew rates for low EMI
- 2 nA supply current in shutdown mode
- Up to 256 transceivers on a bus
- 7 V to +12 V bus common-mode range
- Specified over -40°C to +85°C temperature range
- 8 ns skew
- Available in 8-lead SOIC

APPLICATIONS

- Low power RS-485 applications
- EMI sensitive systems
- DTE-DCE interfaces
- Industrial control
- Packet switching
- Local area networks
- Level translators

GENERAL DESCRIPTION

The ADM3493 is a low power, differential line transceiver designed to operate using a single 3.3 V power supply. Low power consumption, coupled with a shutdown mode, makes it ideal for power-sensitive applications. The ADM3493 is suitable for communication on multipoint bus transmission lines.

The device contains one driver and one receiver. Designed for half-duplex communication, the ADM3493 features a slew rate limited driver that minimizes EMI and reduces reflections caused by improperly terminated cables, allowing error-free data transmission at data rates up to 250 kbps.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

The receiver input impedance is 96 k Ω , allowing up to 256 transceivers to be connected on the bus. A thermal shutdown circuit prevents excessive power dissipation caused by bus contention or by output shorting. If a significant temperature increase is detected in the internal driver circuitry during fault conditions then the thermal shutdown circuit forces the driver output into a high impedance state. The receiver contains a fail-safe feature that results in a logic high output state, if the inputs are unconnected (floating).

The ADM3493 is fully specified over the commercial and industrial temperature ranges and is available in an 8-lead SOIC.

Output Enable Time from Shutdown to High Level, t_{PRSH}		720	1400	ns	$C_L = 15\text{ pF}$ (see Figure 11 and Figure 17)

¹ Measured on $|t_{PLH}(A) - t_{PHL}(A)|$ and $|t_{PLH}(B) - t_{PHL}(B)|$.

² The transceivers are put into shutdown by bringing \overline{RE} high and DE low. If the inputs are in this state for less than 80 ns, the parts are guaranteed not to enter shutdown. If the inputs are in this state for at least 300 ns, the parts are guaranteed to enter shutdown.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 3.

Parameter	Rating
V_{CC} to GND	7 V
Digital I/O Voltage (DE, \overline{RE} , DI)	$-0.3\text{ V to }V_{CC} + 0.3\text{ V}$
Digital I/O Voltage (R_{OUT})	$V_{CC} - 0.5\text{ V to }V_{CC} + 0.5\text{ V}$
Driver Output/Receiver Input Voltage	$-7.5\text{ V to }+12.5\text{ V}$
Operating Temperature Range	$-40^\circ\text{C to }+85^\circ\text{C}$
Storage Temperature Range	$-65^\circ\text{C to }+125^\circ\text{C}$
θ_{JA} Thermal Impedance	
8-Lead SOIC	121°C/W
Lead Temperature	
Soldering (10 seconds)	300°C
Vapor Phase (60 seconds)	215°C
Infrared (15 seconds)	220°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

ADM3493

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 4. . Pin Function Descriptions

Pin No.	Mnemonic	Description
1	RO	Receiver Output. When enabled, if $A > B$ by 200 mV, then RO = high. If $A < B$ by 200 mV, then RO = low.
2	\overline{RE}	Receiver Output Enable. A low level enables the receiver output, RO. A high level places it in a high impedance state. If \overline{RE} is high and DE is low, the device enters a low power shutdown mode.
3	DE	Driver Output Enable. A high level enables the driver differential Outputs A and B. A low level places it in a high impedance state. If \overline{RE} is high and DE is low, the device enters a low power shutdown mode.
4	DI	Driver Input. When the driver is enabled, a logic low on DI forces A low and B high while a logic high on DI forces A high and B low.
5	GND	Ground.
6	A	Noninverting Receiver Input A and Noninverting Driver Output A.
7	B	Inverted Receiver Input B and Inverted Driver Output B.
8	V _{CC}	Power Supply, 3.3 V \pm 0.3 V.

CIRCUIT DESCRIPTION

The ADM3493 is a low power transceiver for RS-485 and RS-422 communications. The ADM3493 can transmit and receive at data rates up to 250 kbps in a half duplex configuration. Driver Enable (DE) and Receiver Enable (\overline{RE}) pins are included when disabled; the driver and receiver outputs are high impedance.

Table 5. Transmitting Truth Table

Transmitting Inputs			Transmitting Outputs		Mode
\overline{RE}	DE	DI	B	A	
X ¹	1	1	0	1	Normal
X ¹	1	0	1	0	Normal
0	0	X ¹	High-Z ²	High-Z ²	Normal
1	0	X ¹	High-Z ²	High-Z ²	Shutdown

¹ X = Don't care.
² High-Z = High Impedance.

Table 6. Receiving Truth Table

Receiving Inputs			Receiving Outputs	Mode
\overline{RE}	DE	A - B	RO	
0	0	$\geq +0.2V$	1	Normal
0	0	$\leq -0.2V$	0	Normal
0	0	Inputs Open	1	Normal
1	0	X ¹	High-Z ²	Shutdown

¹ X = Don't care.
² High-Z = High Impedance

REDUCED EMI AND REFLECTIONS

The ADM3493 is a slew rate limited transceiver, minimizing EMI and reducing reflections caused by improperly terminated cables.

LOW POWER SHUTDOWN MODE

A low power shutdown mode is initiated by bringing both \overline{RE} high and DE low. The ADM3493 does not shut down unless both the driver and receiver are disabled (high impedance). In shutdown, the ADM3493 typically draws only 2 nA of supply current. For the ADM3493, the t_{PSH} and t_{PSL} enable times assume the part was in the low power shutdown mode; the t_{PZH} and t_{PZL} enable times assume the receiver or driver was disabled, but the part was not shut down.

DRIVER OUTPUT PROTECTION

Two methods are implemented to prevent excessive output current and power dissipation caused by faults or by bus contention. Current limit protection on the output stage provides immediate protection against short circuits over the whole common-mode voltage range (see Typical Performance Characteristics). In addition, a thermal shutdown circuit forces the driver outputs into a high impedance state if the die temperature rises excessively.

PROPAGATION DELAY

Skew time is simply the difference between the low-to-high and high-to-low propagation delay. Small driver/receiver skew times help maintain a symmetrical mark-space ratio (50% duty cycle). The receiver skew time, $|t_{PRLH} - t_{PRHL}|$, is 20 ns for the ADM3493. The driver skew time is typically under 100 ns.

TYPICAL APPLICATIONS

The ADM3493 transceiver is designed for bidirectional data communications on multipoint bus transmission lines. Figure 22 shows a typical network application's circuits. To minimize reflections, the line should be terminated at both ends in its characteristic impedance, and stub lengths off the main line should be kept as short as possible. The slew rate limited ADM3493 is tolerant of imperfect termination.

NOTES
 1. R_T IS EQUAL TO THE CHARACTERISTIC IMPEDANCE OF THE CABLE.
