

Low Noise, Low Power, I²C® Bus, 128 Taps, Wiper Only

The ISL22329 integrates two digitally controlled potentiometers (DCP) and non-volatile memory on a monolithic CMOS integrated circuit.

The digitally controlled potentiometers are implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the I²C bus interface. Each potentiometer has an associated volatile Wiper Register (WR) and a non-volatile Initial Value Register (IVR) that can be directly written to and read by the user. The contents of the WR controls the position of the wiper. At power-up the device recalls the contents of the two DCP's IVR to the corresponding WRs.

The DCPs can be used as a voltage divider in a wide variety of applications including control, parameter adjustments, AC measurement and signal processing.

Pinout

Features

- Two potentiometers in one package
- 128 resistor taps
- I²C serial interface
 - Three address pins, up to eight devices/bus
- Non-volatile storage of wiper position
- Wiper resistance: 70Ω typical @ 3.3V
- Shutdown mode
- Shutdown current 5μA max
- Power supply: 2.7V to 5.5V
- 50kΩ or 10kΩ total resistance
- High reliability
 - Endurance: 1,000,000 data changes per bit per register
 - Register data retention: 50 years @ T ≤ +55°C
- 10 Ld MSOP
- Pb-free plus anneal product (RoHS compliant)

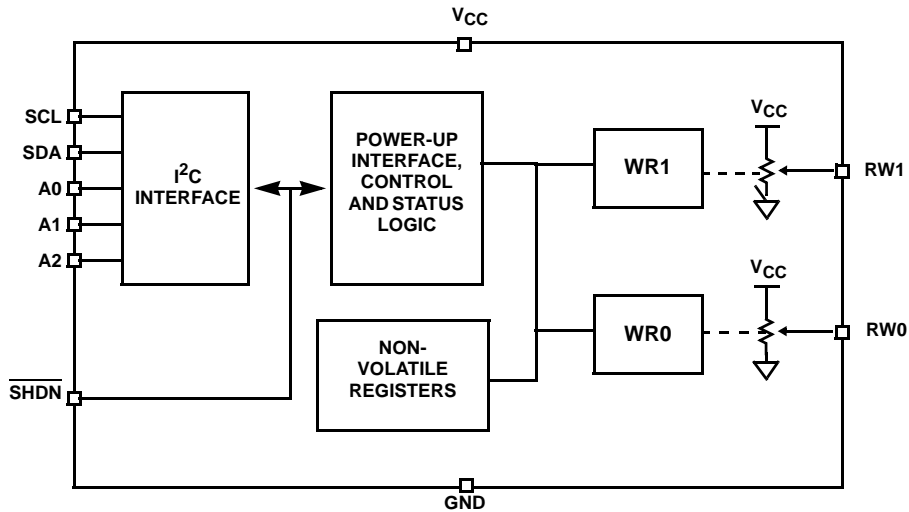

Ordering Information

PART NUMBER	PART MARKING	RESISTANCE OPTION (kΩ)	TEMP. RANGE (°C)	PACKAGE	PKG. DWG. #
ISL22329UFU10Z (Notes 1, 2)	329UZ	50	-40 to +125	10 Ld MSOP (Pb-free)	M10.118
ISL22329WFU10Z (Notes 1, 2)	329WZ	10	-40 to +125	10 Ld MSOP (Pb-free)	M10.118

NOTES:

1. Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
2. Add "-TK" suffix for 1,000 Tape and Reel option

Pin Descriptions

MSOP PIN	SYMBOL	DESCRIPTION
1	A2	Device address input for the I ² C interface
2	SCL	Open drain I ² C interface clock input
3	SDA	Open drain serial data I/O for the I ² C interface
4	GND	Device ground pin
5	RW1	"Wiper" terminal of DCP1
6	A0	Device address input for the I ² C interface
7	A1	Device address input for the I ² C interface
8	V _{CC}	Power supply pin
9	$\overline{\text{SHDN}}$	Shutdown active low input
10	RW0	"Wiper" terminal of DCP0

Absolute Maximum Ratings

Storage Temperature -65°C to +150°C
 Voltage at any Digital Interface Pin
 with Respect to GND -0.3V to $V_{CC}+0.3$
 V_{CC} -0.3V to +6V
 Voltage at any DCP Pin with Respect to GND -0.3V to V_{CC}
 Lead Temperature (Soldering, 10s) +300°C
 I_W (10s) ±6mA
 Latchup (Note 4) Class II, Level B @ +125°C
 ESD (HBM) 2.5kV
 (CDM) 1kV

Thermal Information

Thermal Resistance (Typical, Note 3) θ_{JA} (°C/W)
 10 Lead MSOP package 120
 Maximum Junction Temperature (Plastic Package) +150°C

Recommended Operating Conditions

Ambient Temperature -40°C to +125°C
 V_{CC} Voltage for DCP Operation 2.7V to 5.5V
 Wiper Current -3mA to 3mA
 Power Rating 5mW

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

3. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
4. Jedec Class II pulse conditions and failure criterion used. Level B exceptions are: using a max positive pulse of 6.5V on the SHDN pin, and using a max negative pulse of -0.8V for all pins.

Analog Specifications Over recommended operating conditions unless otherwise stated.

NOTES:

- Typical values are for T_A = +25°C and 3.3V supply voltage.
- LSB: [V(R_W)₁₂₇ - V(R_W)₀]/127. V(R_W)₁₂₇ and V(R_W)₀ are V(R_W) for the DCP register set to 7F hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
- ZS error = V(R_W)₀/LSB.
- FS error = [V(R_W)₁₂₇ - V_{CC}]/LSB.
- DNL = [V(R_W)_i - V(R_W)_{i-1}]/LSB-1, for i = 1 to 127. i is the DCP register setting.
- INL = [V(R_W)_i - i • LSB - V(R_W)₀]/LSB for i = 1 to 127.
- V_{MATCH} = [V(R_W)_x - V(R_W)_y]/LSB, for i = 1 to 127, x = 0 to 1 and y = 0 to 1.
- TC_V = $\frac{\text{Max}(V(RW)_i) - \text{Min}(V(RW)_i)}{[\text{Max}(V(RW)_i) + \text{Min}(V(RW)_i)]/2} \times \frac{10^6}{165^\circ\text{C}}$ for i = 16 to 112 decimal, T = -40°C to +125°C. Max () is the maximum value of the wiper voltage and Min () is the minimum value of the wiper voltage over the temperature range.
- This parameter is not 100% tested.
- t_{WC} is the time from a valid STOP condition at the end of a Write sequence of I²C serial interface, to the end of the self-timed internal non-volatile write cycle.

Pin Descriptions

Potentiometers Pins

RWi (i = 0,1)

RWi is the wiper terminal and is equivalent to the movable terminal of a mechanical potentiometer. The position of the wiper within the array is determined by the WRi register.

SHDN

The SHDN pin forces the resistors to end-to-end open circuit condition and shorts all RWs to GND. When SHDN is returned to logic high, the previous latch settings put RWi at the same resistance setting prior to shutdown. This pin is logically OR'd with SHDN bit in ACR register. I²C interface is

still available in shutdown mode and all registers are accessible. This pin must remain HIGH for normal operation.

FIGURE 11. DCP CONNECTION IN SHUTDOWN MODE

Bus Interface Pins

Serial Data Input/Output (SDA)

The SDA is a bidirectional serial data input/output pin for I²C interface. It receives device address, operation code, wiper address and data from an I²C external master device at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock.

SDA requires an external pull-up resistor, since it is an open drain input/output.

Serial Clock (SCL)

This is the serial clock input of the I²C serial interface. SCL requires an external pull-up resistor, since it is an open drain input.

Device Address (A2 - A0)

The address inputs are used to set the least significant 3 bits of the 7-bit I²C interface slave address. A match in the slave address serial data stream must match with the Address input pins in order to initiate communication with the ISL22329. A maximum of 8 ISL22329 devices may occupy the I²C serial bus.

Principles of Operation

The ISL22329 is an integrated circuit incorporating two DCPs with their associated registers, non-volatile memory and an I²C serial interface providing direct communication between a host and the potentiometers and memory. The resistor arrays are comprised of individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the potential at that point to the wiper.

The electronic switches on the device operate in a “make before break” mode when the wiper changes tap positions.

When the device is powered down, the last value stored in IVR_i will be maintained in the non-volatile memory. When power is restored, the contents of the IVR_i are recalled and loaded into the corresponding WR_i to set the wipers to the initial value.

DCP Description

Each DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of each DCP are equivalent to the fixed terminals of a mechanical potentiometer and internally connected to V_{CC} and GND. The RW pin of each DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by volatile Wiper Register (WR). Each DCP has its own WR. When the WR of a DCP contains all zeroes (WR[6:0]= 00h), its wiper terminal (RW) is closest to GND. When the WR register of a DCP contains all ones (WR[6:0]= 7Fh), its wiper terminal (RW) is closest to V_{CC}. As the value of the WR increases from all zeroes (0) to all ones

(127 decimal), the wiper moves monotonically from the position closest to GND to the closest to V_{CC}.

While the ISL22329 is being powered up, all WRs are reset to 40h (64 decimal), which locates RW roughly at the center between GND and V_{CC}. After the power supply voltage becomes large enough for reliable non-volatile memory reading, all WRs will be reload with the value stored in corresponding non-volatile Initial Value Registers (IVRs).

The WRs can be read or written to directly using the I²C serial interface as described in the following sections. The I²C interface Address Byte has to be set to 00h or 01h to access the WR of DCP0 or DCP1 respectively.

Memory Description

The ISL22329 contains seven non-volatile and three volatile 8-bit registers. The memory map of ISL22329 is on Table 1. The two non-volatile registers (IVR_i) at address 0 and 1, contain initial wiper value and volatile registers (WR_i) contain current wiper position. In addition, five non-volatile General Purpose registers from address 2 to address 6 are available.

TABLE 1. MEMORY MAP

ADDRESS	NON-VOLATILE	VOLATILE
8	—	ACR
7	Reserved	
6	General Purpose	Not Available
5	General Purpose	Not Available
4	General Purpose	Not Available
3	General Purpose	Not Available
2	General Purpose	Not Available
1	IVR1	WR1
0	IVR0	WR0

The non-volatile IVR_i and volatile WR_i registers are accessible with the same address.

The Access Control Register (ACR) contains information and control bits described below in Table 2. The VOL bit at access control register (ACR[7]) determines whether the access is to wiper registers WR_i or initial value registers IVR_i.

TABLE 2. ACCESS CONTROL REGISTER (ACR)

VOL	SHDN	WIP	0	0	0	0	0

If VOL bit is 0, the non-volatile IVR_i registers are accessible. If VOL bit is 1, only the volatile WR_i are accessible. Note, value is written to IVR_i register also is written to the corresponding WR_i. The default value of this bit is 0.

The SHDN bit (ACR[6]) disables or enables Shutdown mode. This bit is logically OR'd with SHDN pin. When this bit is 0, DCPs are in Shutdown mode. Default value of SHDN bit is 1.

The WIP bit (ACR[5]) is read only bit. It indicates that non-volatile write operation is in progress. It is impossible to write to the IVR_i, WR_i or ACR while WIP bit is 1.

I²C Serial Interface

The ISL22329 supports an I²C bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both transmit and receive operations. Therefore, the ISL22329 operates as a slave device in all applications.

All communication over the I²C interface is conducted by sending the MSB of each byte of data first.

Protocol Conventions

Data states on the SDA line must change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (See Figure 12). On power-up of the ISL22329 the SDA pin is in the input mode.

All I²C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL22329 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (See Figure 12). A START condition is ignored during the power-up of the device.

All I²C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while

SCL is HIGH (See Figure 12). A STOP condition at the end of a read operation, or at the end of a write operation places the device in its standby mode.

An ACK, Acknowledge, is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (See Figure 13).

The ISL22329 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The ISL22329 also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation.

A valid Identification Byte contains 1010b as the four MSBs, and the following three bits matching the logic values present at pins A2, A1, and A0. The LSB is the Read/Write bit. Its value is "1" for a Read operation, and "0" for a Write operation (See Table 3).

TABLE 3. IDENTIFICATION BYTE FORMAT

Logic values at pins A2, A1, and A0 respectively

1	0	1	0	A2	A1	A0	R/W
(MSB)				(LSB)			

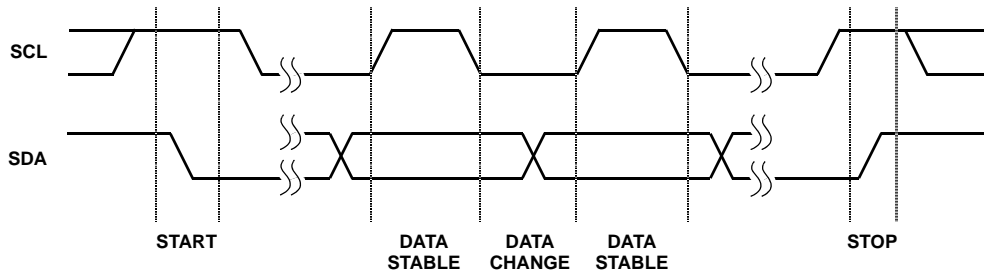

FIGURE 12. VALID DATA CHANGES, START, AND STOP CONDITIONS

FIGURE 13. ACKNOWLEDGE RESPONSE FROM RECEIVER

FIGURE 14. BYTE WRITE SEQUENCE

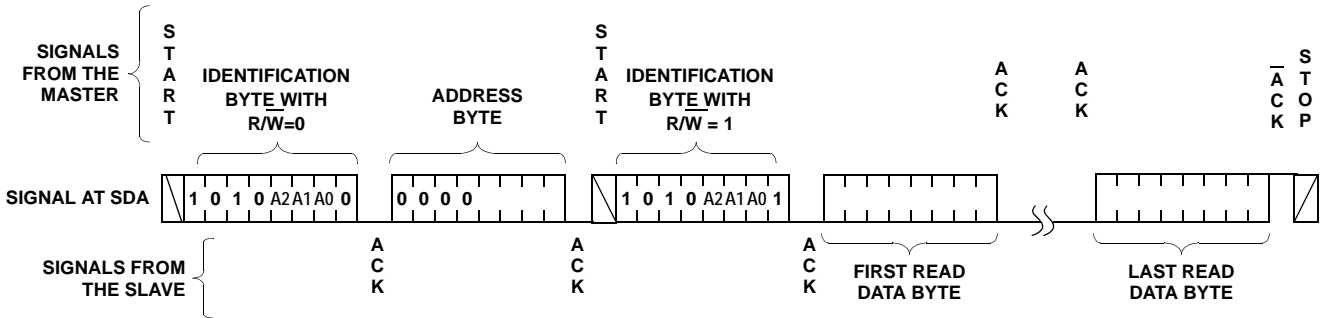

FIGURE 15. READ SEQUENCE

Write Operation

A Write operation requires a START condition, followed by a valid Identification Byte, a valid Address Byte, a Data Byte, and a STOP condition. After each of the three bytes, the ISL22329 responds with an ACK. At this time, the device enters its standby state (See Figure 14). Device can receive more than one byte of data by auto incrementing the address after each received byte. Note after reaching the address 08h, the internal pointer “rolls over” to address 00h.

Non-volatile write cycle starts after STOP condition is determined and it requires up to 20 ms delay for the next non-volatile write. Thus, non-volatile registers must be written individually.

Read Operation

A Read operation consist of a three byte instruction followed by one or more Data Bytes (See Figure 15). The master initiates the operation issuing the following sequence: a START, the Identification byte with the R/W bit set to “0”, an Address Byte, a second START, and a second Identification byte with the R/W bit set to “1”. After each of the three bytes, the ISL22329 responds with an ACK. Then the ISL22329 transmits Data Bytes as long as the master responds with an ACK during the SCL cycle following the eighth bit of each byte. The Data Bytes are from the registers indicated by an internal pointer. This pointer initial value is determined by the Address Byte in the Read operation instruction, and increments by one during transmission of each Data Byte.

After reaching the memory location 08h, the pointer “rolls over” to 00h, and the device continues to output data for each ACK received. The master terminates the read operation (issuing a $\overline{\text{ACK}}$ and STOP condition) following the last bit of the last Data Byte (See Figure 15).

The Data Bytes are from the registers indicated by an internal pointer. This pointer initial value is determined by the Address Byte in the Read operation instruction, and increments by one during transmission of each Data Byte. After reaching the memory location 08h, the pointer “rolls over” to 00h, and the device continues to output data for each ACK received.

In order to read back the non-volatile IVR, it is recommended that the application reads the ACR first to verify the WIP bit is 0. If the WIP bit (ACR[5]) is not 0, the host should repeat its reading sequence again.

NOTES:

1. These package dimensions are within allowable dimensions of JEDEC MO-187BA.
2. Dimensioning and tolerancing per ANSI Y14.5M-1994.
3. Dimension "D" does not include mold flash, protrusions or gate burrs and are measured at Datum Plane. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E1" does not include interlead flash or protrusions and are measured at Datum Plane. **-H-** Interlead flash and protrusions shall not exceed 0.15mm (0.006 inch) per side.
5. Formed leads shall be planar with respect to one another within 0.10mm (.004) at seating Plane.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08mm (0.003 inch) total in excess of "b" dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07mm (0.0027 inch).
10. Datums **-A-** and **-B-** to be determined at Datum plane **-H-**.
11. Controlling dimension: MILLIMETER. Converted inch dimensions are for reference only
