

Cordless Telephone Signal Processor

Description

The programmable cordless phone signal processor includes all necessary low frequency parts such as microphone- and earphone amplifier, compander, pre-emphasis, deemphasis, scrambler, data management, power-supply management, as well as RF receiving parts

such as IF converter, FM demodulator. RSSI and low noise amplifier.

Several gains and mutes in transmit and receive direction are controlled by serial bus while compander, pre- and deemphasis and scrambler can be bypassed.

Features

RF Receiver Part

- Low-noise amplifier
- IF converter
- FM demodulator
- RSSI

Low Frequency Part

- Symmetrical input of microphone amplifier
- Symmetrical output of earpiece amplifier

- Compander
- Pre- and deemphasis
- Scrambler
- Data management
- Power-supply management
- Serial bus

Application: CT0

Block Diagram

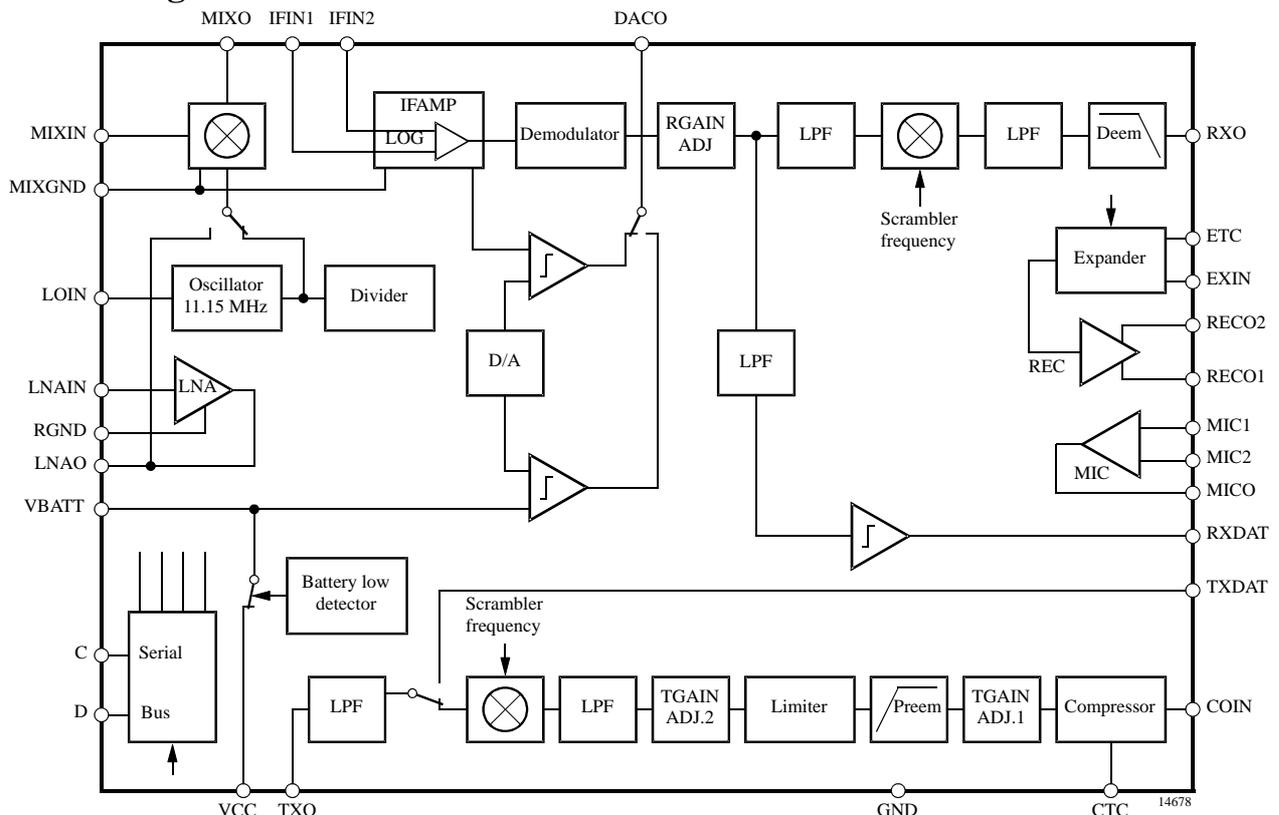

Figure 1. Block diagram

Pin Description

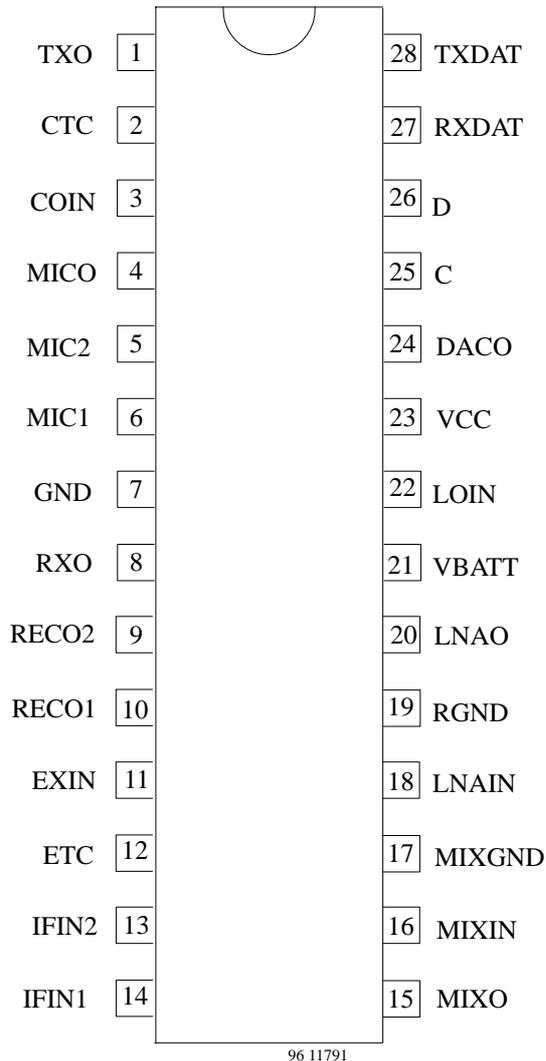

Figure 2. Pinning

Pin	Symbol	Function
1	TXO	Transmit section analog output
2	CTC	Compressor time constant control analog output
3	COIN	Compressor analog input
4	MICO	Microphone amplifier output
5	MIC2	Non-inverting input of microphone amplifier
6	MIC1	Inverting input of microphone amplifier
7	GND	LF analog/ digital ground
8	RXO	Intermediate receive analog output
9	RECO2	Symmetrical output of receive amplifier
10	RECO1	Symmetrical output of receive amplifier
11	EMN	Expander analog input
12	ETC	Expander time constant control analog output
13	IFIN2	Symmetrical IF amplifier input
14	IFIN1	Symmetrical IF amplifier input
15	MIXO	Mixer output
16	MIXIN	Mixer input
17	MIXGND	IF amplifier and mixer ground
18	LNAIN	Low-noise amplifier input
19	RGND	Low-noise amplifier ground
20	LNAO	Low-noise amplifier output/ External LO input
21	VBATT	Battery supply
22	LOIN	Local oscillator input (11.15 MHz)
23	VCC	Supply-voltage output for peripherals and internal supply of digital part
24	DACO	D/A comparator output
25	C	Clock input of serial bus
26	D	Data input of serial bus
27	RXDAT	Receive data digital output
28	TXDAT	Transmit data input

Serial Bus Interface

The circuit is remoted by an external microcontroller through the serial bus (programming can be started 10 μ s after power supply settled).

The data is an 12-bit word:

A3 – A0: address of the destination register (0 to 15)

D7 – D0: contents of register

The data line must be stable when the clock is high and data must be serially shifted.

After 12 clock periods, the transfer to the destination register is (internally) generated by a low-to-high transition of the data line when the clock is high.

-------	-------	-------	-------	-------	-------	-------	-------

G2TX(3:0): Gain adjustment TX after limiter

G1TX(3:0): Gain adjustment TX

R3: Enable functions receive

GDEM	EDDE	EEA	ERXO	ERX1	ERXHF	ELNA	ERX2
------	------	-----	------	------	-------	------	------

GDEM: Gain demodulator

EDDE: Enable deemphasis (disables bypass)

EEA: Enable earpiece amplifier

ERXO: Enable RXO output

ERXHF: Enable mixer and IF amplifier

ELNA: Enable low-noise amplifier

ERX(1:0): Enable parts of RXLF

R4: Enable functions transmit

SSCCK	RBAT	BCOMP	BSCR	GMIC	ETDM	EPREE	ETX
-------	------	-------	------	------	------	-------	-----

SSCCK: Shift SC-clock (shifts SC-clock by 17/16)

RBAT: Battery detection high/low range

BCOMP: Bypass compressor and expander

BSCR: Bypass scrambler and descrambler

GMIC: Gain of microphone preamplifier

ETDM: Enable transmit data management

EPREE: Enable preemphasis (disables bypass)

ETX: Enable TX low frequency part

R5:

free	free	free	free	free	free	GEA4	EXTLO

Ozone Depleting Substances Policy Statement

It is the policy of **TEMIC Semiconductor GmbH** to

1. Meet all present and future national and international statutory requirements.
2. Regularly and continuously improve the performance of our products, processes, distribution and operating systems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.

It is particular concern to control or eliminate releases of those substances into the atmosphere which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) intend to severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

TEMIC Semiconductor GmbH semiconductor division has been able to use its policy of continuous improvements to eliminate the use of ODSs listed in the following documents.

1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively
2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA
3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

TEMIC Semiconductor GmbH can certify that our semiconductors are not manufactured with ozone depleting substances and do not contain such substances.

We reserve the right to make changes to improve technical design and may do so without further notice.

Parameters can vary in different applications. All operating parameters must be validated for each customer application by the customer. Should the buyer use TEMIC products for any unintended or unauthorized application, the buyer shall indemnify TEMIC against all claims, costs, damages, and expenses, arising out of, directly or indirectly, any claim of personal damage, injury or death associated with such unintended or unauthorized use.
