Preface

Thank you very much for making use of Toshiba microcomputer LSIs.
Before use this LSI, refer the section, "Points of Note and Restrictions".
Especially, take care below cautions.

****CAUTION****

How to release the HALT mode

Usually, interrupts can release all halts status. However, the interrupts = ($\overline{\text{NMI}}$, INT0 to 4, INTRTC) which can release the HALT mode may not be able to do so if they are input during the period CPU is shifting to the HALT mode (for about 5 clocks of f_{FPH}) with IDLE1 or STOP mode (IDLE2 is not applicable to this case). (In this case, an interrupt request is kept on hold internally.)

If another interrupt is generated after it has shifted to HALT mode completely, halt status can be released without difficultly. The priority of this interrupt is compare with that of the interrupt kept on hold internally, and the interrupt with higher priority is handled first followed by the other interrupt.

Input Voltage	VIN	-0.5 to Vcc + 0.5	V
Output Current	IOL	2	mA
Output Current	IOH	-2	mA

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

- Input Level: High = 0.9 V_{cc}, Low = 0.1 V_{cc}

Note: "x" used in an expression shows a frequency for the clock f_{FPH} selected by SYSCR1<SYSCK>.
The value of "x" changes according to whether a clock gear or a low-speed oscillator is selected.
An example value is calculated for fc, with gear=1/fc (SYSCR1<SYSCK, GEAR2 to 0> = 0000).

AC Measuring Conditions

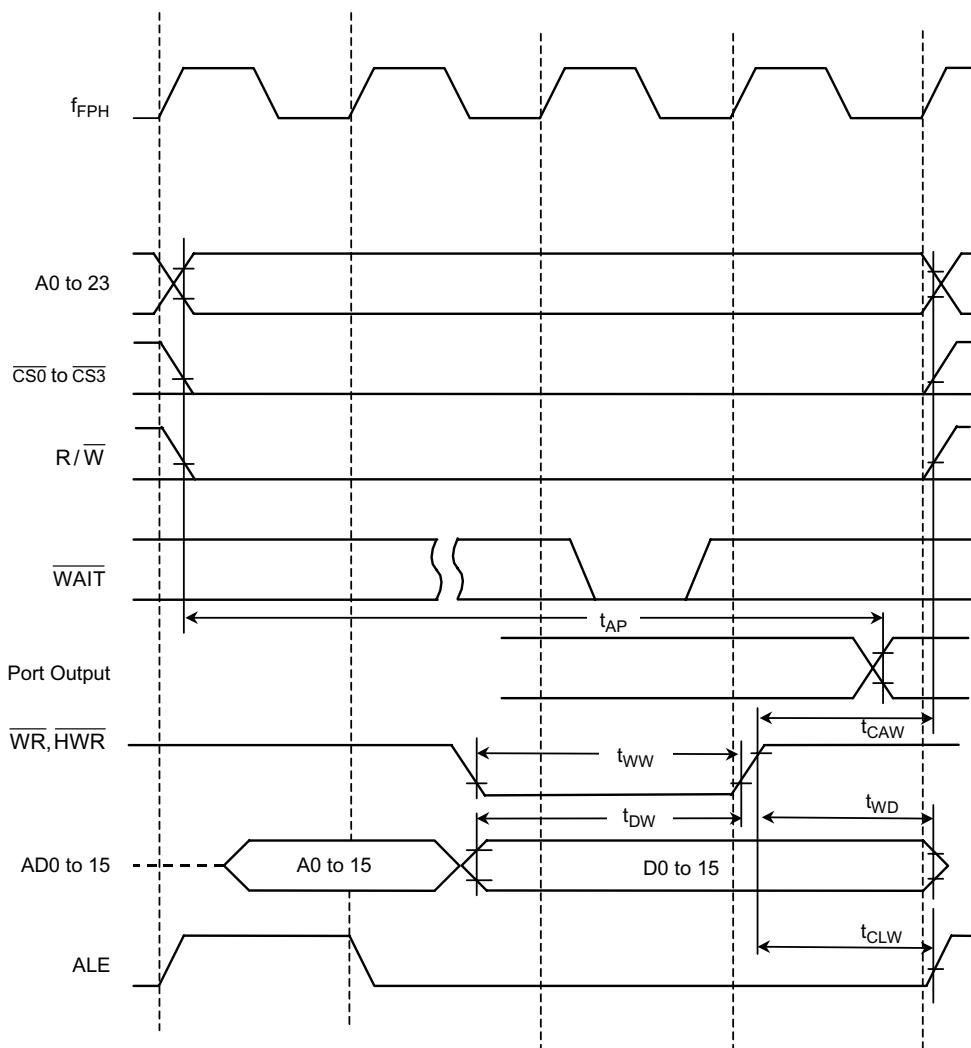

- Output Level: High = 0.7 V_{CC} , Low = 0.3 V_{CC} , CL = 50 pF
- Input Level: High = 0.9 V_{CC} , Low = 0.1 V_{CC}

Note: "x" used in an expression shows a frequency for the clock f_{FPH} selected by SYSCR1<SYSCK>.
The value of "x" changes according to whether a clock gear or a low-speed oscillator is selected. An example value is calculated for fc, with gear = 1/fc (SYSCR1<SYSCK, GEAR2 to 0> = 0000).

4.9 Bus Request/Bus Acknowledge

Symbol	Paramter	Variable		$f_{FPH} = 10 \text{ MHz}$		$f_{FPH} = 27 \text{ MHz}$		Condition	Unit
		Min	Max	Min	Max	Min	Max

		0	300	0	300	0	300	$V_{cc} < 2.7 \text{ V}$	

Note 1: Even if the **BUSRQ** Signal goes Low, the bus will not be released while the **WAIT** signal is Low. The bus will only be released when **BUSRQ** goes Low while **WAIT** is High.

Note 2: This line shows only that the output buffer is in the Off state.

It does not indicate that the signal level is fixed.

Just after the bus is released, the signal level set before the bus was released is maintained dynamically by the external capacitance. Therefore, to fix the signal level using an external resistor during bus release, careful design is necessary, since fixing of the level is delayed.

The internal programmable pull-up/pull-down resistor is switched between the active and non-active states by the internal signal.

4.10 Recommended Oscillation Circuit

The TMP91CY22F has been evaluated by the following resonator manufacturer. The evaluation results are shown below for your information.

Note: The load capacitance of the oscillation terminal is the sum of the load capacitances of C1 and C2 to be connected and the stray capacitance on the board. Even if the ratings of C1 and C2 are used, the load capacitance varies with each board and the oscillator may malfunction. Therefore, when designing a board, make the pattern around the oscillation circuit shortest. It is recommended that final evaluation of the resonator be performed on the board.
