

Preliminary W27E02

256K ' 8 ELECTRICALLY ERASABLE EPROM

1. GENERAL DESCRIPTION

The W27E02 is a high speed, low power consumption Electrically Erasable and Programmable Read Only Memory organized as $262,144 \times 8$ bits. It requires only one supply in the range of $5.0V \pm 10\%$ in normal read mode. The W27E02 provides an electrical chip erase function.

2. FEATURES

- Single power supply voltage: $5.0V \pm 10\%$
- High speed access time: 70/90 nS (max.)
- Read operating current: 30 mA (max.)
- Erase/Programming operating current: 30 mA (max.)
- Standby current: 20 μA (max.)
- +12V erase/programming voltage
- Fully static operation
- All inputs and outputs directly TTL/CMOS compatible
- Three-state outputs
- Available packages: 32-pin 600 mil DIP, 32-lead PLCC and 32-lead STSOP

3. PIN CONFIGURATIONS

4. BLOCK DIAGRAM

5. PIN DESCRIPTION

SYMBOL	DESCRIPTION
A0 – A17	Address Inputs
Q0 – Q7	Data Inputs/Outputs
#CE	Chip Enable
#OE	Output Enable
#PGM	Program Enable
VPP	Program/Erase Supply Voltage
VDD	Power Supply
VSS	Ground
NC	No Connection

6. FUNCTIONAL DESCRIPTION

Read Mode

Like conventional UVEPROMs, the W27E02 has two control functions and both of these produce data at the outputs.

#CE is for power control and chip select. #OE controls the output buffer to gate data to the output pins. When addresses are stable, the address access time (TACC) is equal to the delay from #CE to output (TCE), and data are available at the outputs TOE after the falling edge of #OE, if TACC and TCE timings are met.

Erase Mode

The erase operation is the only way to change data from "0" to "1." Unlike conventional UVEPROMs, which use ultraviolet light to erase the contents of the entire chip (a procedure that requires up to half an hour), the W27E02 uses electrical erasure. Generally, the chip can be erased within 100 mS by using an EPROM writer with a special erase algorithm.

There are two ways to enter Erase mode. One is to raise VPP to VPE (12V), VDD = VCE (5.0V), #CE low, #OE high, A9 = VHH (12V), and all other address pins are kept at fixed low or high. Pulsing #PGM low starts the erase operation. The other way is somewhat like flash, by programming two consecutive commands into the device and then enter Erase mode. The two commands are loading Data = AA(hex) to Addr. = 5555(hex) and Data = 10(hex) to Addr. = 2AAA(hex). Be careful to note that the #PGM pulse widths of these two commands are different: One is 100 μ S, while the other is 100 mS. Please refer to the Smart Erase Algorithm 1 & 2.

Erase Verify Mode

After an erase operation, all of the bytes in the chip must be verified to check whether they have been successfully erased to "1" or not. The erase verify mode automatically ensures a substantial erase margin. This mode will be entered after the erase operation if VDD = VPE (5.0V), #CE low, and #OE low, #PGM high.

Program Mode

Programming is performed exactly as it is in conventional UVEPROMs, and programming is the only way to change cell data from "1" to "0." The program mode is entered when VPP is raised to VPP (12V), VDD = VCP (5.0V), #CE low, #OE high, the address pins equal the desired addresses, and the input pins equal the desired inputs. Pulsing #PGM low starts the programming operation.

Program Verify Mode

All of the bytes in the chip must be verified to check whether they have been successfully programmed with the desired data or not. Hence, after each byte is programmed, a program verify operation should be performed. The program verify mode automatically ensures a substantial program margin. This mode will be entered after the program operation if VPP = VPP (12V), #CE low, #OE low, and #PGM high.

Erase/Program Inhibit

Erase or program inhibit mode allows parallel erasing or programming of multiple chips with different data. When #CE high, erasing or programming of non-target chips is inhibited, so that except for the #CE, the W27E02 may have common inputs.

Standby Mode

The standby mode significantly reduces V_{DD} current. This mode is entered when $\#CE$ high. In standby mode, all outputs are in a high impedance state, independent of $\#OE$ and $\#PGM$.

Two-line Output Control

Since EPROMs are often used in large memory arrays, the W27E02 provides two control inputs for multiple memory connections. Two-line control provides for lowest possible memory power dissipation and ensures that data bus contention will not occur.

System Considerations

EPROM power switching characteristics require careful device decoupling. System designers are concerned with three supply current issues: standby current levels (I_{SB}), active current levels (I_{CC}), and transient current peaks produced by the falling and rising edges of $\#CE$. Transient current magnitudes depend on the device output's capacitive and inductive loading. Two-line control and proper decoupling capacitor selection will suppress transient voltage peaks. Each device should have a $0.1 \mu F$ ceramic capacitor connected between its V_{DD} and V_{SS} . This high frequency, low inherent-inductance capacitor should be placed as close as possible to the device. Additionally, for every eight devices, a $4.7 \mu F$ electrolytic capacitor should be placed at the array's power supply connection between V_{DD} and V_{SS} . The bulk capacitor will overcome voltage slumps caused by PC board trace inductances.

7. TABLE OF OPERATING MODES

$V_{DD} = 5.0V \pm 10\%$, $V_{pp} = V_{PE} = V_{HH} = 12V$, $V_{CP} = V_{PE} = V_{CE} = 5.0V$, $X = V_{IH}$ or V_{IL}

MODE	PINS								
	$\#CE$	$\#OE$	$\#PGM$	A0	A9	OTER ADDR	V_{DD}	V_{PP}	OUTPUTS
Read	V_{IL}	V_{IL}	X	X	X	X	V_{DD}	V_{DD}	DOUT
Output Disable	V_{IL}	V_{IH}	X	X	X	X	V_{DD}	V_{DD}	High Z
Standby (TTL)	V_{IH}	X	X	X	X	X	V_{DD}	V_{DD}	High Z

8. DC CHARACTERISTICS

Absolute Maximum Ratings

PARAMETER	RATING	UNIT
Operation Temperature	0 to +70	°C
Storage Temperature	-65 to +125	°C
Voltage on all Pins with Respect to Ground Except VDD, VPP and A9 Pins	-0.5 to VDD +0.5	V
Voltage on VDD Pin with Respect to Ground	-0.5 to +7.0	V
Voltage on VPP Pin with Respect to Ground	-0.5 to +14.5	V
Voltage on A9 Pin with Respect to Ground	-0.5 to +14.5	V

Note: Exposure to conditions beyond those listed under Absolute Maximum Ratings may adversely affect the life and reliability of the device.

9. CAPACITANCE

(VDD = 5.0V ±10%, TA = 25° C, f = 1 MHz)

PARAMETER	SYMBOL	CONDITIONS	MAX.	UNIT
Input Capacitance	CIN	VIN = 0V	6	pF
Output Capacitance	COUT	VOU = 0V	12	pF

10. READ OPERATION DC CHARACTERISTICS

(VDD = 5.0V ±10%, TA = 0 to 70° C)

PARAMETER	SYM.	CONDITIONS	LIMITS			UNIT
			MIN.	TYP.	MAX.	
Input Load Current	ILI	VIN = 0V to VDD	-5	-	5	μA
Output Leakage Current	ILO	VOU = 0V to VDD	-10	-	10	μA
Standby VDD Current (TTL input)	ISB	#CE = VIH	-	-	1	mA
Standby VDD Current (CMOS input)	ISB1	#CE = VDD ±0.2V	-	-	100	μA
VDD Operating Current	ICC	#CE = VIL, IOUT = 0 mA, f = 5 MHz	-	-	30	mA
VPP Operating Current	IPP	VPP = VDD	-	-	10	μA
Input Low Voltage	VIL	-	-0.3	-	0.8	V
Input High Voltage	VIH	-	2.0	-	VDD +0.5	V
Output Low Voltage	VOL	IOL = 1.6 mA	-	-	0.4	V
Output High Voltage	VOH	IOH = -0.1 mA	2.4	-	-	V
VPP Operating Voltage	VPP	-	VDD -0.7	-	VDD	V

Preliminary W27E02

Program/Erase DC Characteristics

(TA = 25° C, VDD = 5.0V ±10 %, VHH = 12V)

PARAMETER	SYM.	CONDITIONS	LIMITS			UNIT
			MIN.	TYP.	MAX.	
Input Load Current	ILI	VIN = VIL or VIH	-10	-	10	μA
