

XC62E Series

Boosting Voltage Regulators

- ◆ CMOS Low Power Consumption
- ◆ Small Input-Output Voltage Differential
: 0.1V @ 100mA
- ◆ Maximum Output Current : 1000mA
- ◆ Output Voltage Range : 2V~6V
- ◆ Output Voltage Accuracy : $\pm 2\%$

General Description

The XC62E series are a group of positive output voltage regulators that can supply up to 1A of output current using an external transistor. Low power and high accuracy are achieved through CMOS process and laser trimming technologies.

The series consists of a high precision voltage reference, an error correction circuit and a short-circuit protected output driver.

In stand-by mode, supply current can be dramatically cut. Since the input-output voltage differential is small, loss control efficiency is good.

The XC62E is particularly suited for use with battery operated portable products, and products where supply current regulation is required.

The series comes in an ultra small SOT-25 package.

In connection with the CE function, apart from the negative logic XC62EP series, a positive logic XC62ER series (custom) is also available.

Applications

- Portable Cameras and Video Recorders
- Battery Powered Equipment
- Palmtops
- Reference Voltage Sources

3

Features

- Ultra Small Input-Output Voltage Differential**
: 100mA of output current is available with a differential of 0.1V. (Performance depends on the external transistor characteristics.)
- Maximum Output Current** : 1000mA
- Output Voltage Range** : 2V ~ 6V in 0.1V increments
- Highly Accurate** : Set-up voltage $\pm 2\%$
- Low Power Consumption** : Typ. 50 μ A ($V_{OUT}=5.0V$)
: Typ. 0.2 μ A (Stand-by)
- Output Voltage Temperature Characteristics**
: Typ. ± 100 ppm/ $^{\circ}$ C
- Input Stability** : Typ. 0.1%/V
- Ultra Small Packages** : SOT-25 mini-mold

Typical Application Circuit

Standard Circuit

Peripherals :

PNP Tr : 2SA1213

R_{BE} : 20kΩ~47kΩ

R_B : Please refer to Note 2 on the following page.

C_{IN} : 10μF(Tantalum)

C_L : 47μF(Tantalum) 10μF minimum

3

Operational Explanation

Functional Description

Output voltage (V_{OUT}) can be fixed by revising the external transistor's base current. This can be done by comparing the detected voltage level and the set voltage power supply level.

With the XC62EP (CE negative voltage), if a voltage above the \overline{CE} pin's "H" level is applied, the IC will enter stand-by mode where the base and differential amplifier's currents are regulated.

Directions for use

Suggestions for External Components

1. PNP Transistor

The selection of a transistor should take into account output current, input voltage and power dissipation for each specific application. It is recommended that a transistor that has a low output saturated voltage (V_{CE}) and high h_{FE} characteristics be used.

2. R_B Resistor

Although the IC unit is protected by a base current remitter circuit, it is recommended that a resistor (R_B) be connected between the transistor's base and the IC's EXT pin to protect the transistor.

Required output current can be calculated using the following equation although characteristic variations and conditions of use should be carefully checked before use. The following equation also indicates the conditions needed to obtain I_{OUT}(max.) at V_{IN}(min.). However, the larger the input current, the larger the output current (I_{OUT}) that can be obtained.

$$\frac{V_{IN(min)} - 1.2(V)}{R_B} - \frac{0.7(V)}{R_{BE}} > \frac{I_{OUT(max)}}{h_{FE}}$$

3. R_{BE} Resistor, C_L Capacitor

To prevent oscillation due to output load variation, use of a phase compensation capacitor C_L is recommended. Please use a Tantalum capacitor of at least 10μF. Please also use an R_{BE} resistor of less than 47kΩ.

An R_{BE} resistor of between 20kΩ and 47kΩ is recommended for less power consumption.

4. Input Impedance

In order to control oscillation brought about as a result of impedance at the power supply line, connect a capacitor of 10μF or more (Tantalum) between the external transistor's emitter and the ground pin.

Special Note

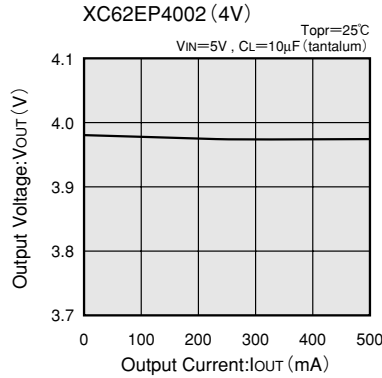

1. Protection Circuit

The built-in protect circuit is to protect the IC only. Therefore to prevent output shorts and overshoot current through the transistor, use of a resistor R_B or an overshoot current protection circuit is recommended.

Care should also be taken with the transistor's power dissipation.
