

CMOS 4-BIT D-TYPE REGISTER

FEATURES

- ◆ 3-State Outputs with Gated Control Lines
- ◆ Fully Independent Clock
- ◆ Asynchronous Reset
- ◆ Fully Static Operation - DC to 12MHz @ 10Vdc

DESCRIPTION

The 4076B 4-bit Register consists of four D-Type flip-flops operating synchronously from a common Clock. OR-gated Output Disable inputs force the outputs into a high-impedance state for use in bus-organized systems. OR-gated Data Disable inputs cause the Q outputs to be fed back to the D inputs of the flip-flops. Thus, they are inhibited from changing state while the clocking process remains undisturbed. An asynchronous Master Reset is provided to clear all four flip-flops simultaneously independent of the Clock or Disable inputs.

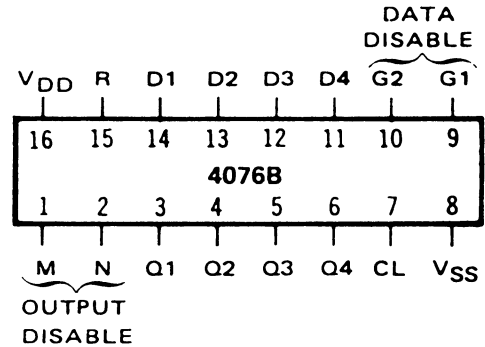

TRUTH TABLE

Reset	Clock	Data Input Disable		Data D	Next State Output Q	
		G1	G2			
1	X	X	X	X	0	
0	0	X	X	X	Q	NC
0		1	X	X	Q	NC
0		X	1	X	Q	NC
0		0	0	1	1	
0		0	0	0	0	
0	1	X	X	X	Q	NC
0		X	X	X	Q	NC

When either Output Disable M or N is high, the outputs are disabled (high impedance state); however sequential operation of the flip-flops is not affected.

1 ≡ High Level X = Don't Care
 0 ≡ Low Level NC = No Change
