

CDA3S06L

Voltage: 8 Volts Current: 50 mA

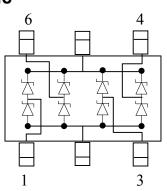

Marking "CDA3"

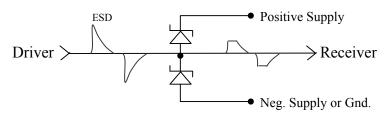

Feature

This diode network is designed to provide four channels for active termination of high-speed data signals to eliminate signal undershoot and overshoot. The network has the added benefit of acting to suppress any ESD voltage events by shunting the energy to ground assuring maximum reliability of electronic systems in the field. Trigger levels are defined by the positive and negative bias levels set by the user.
