Descriptions

IRIS-G6653 is a hybrid IC consists from power MOSFET and a controller IC, designed for Quasi-Resonant (including low frequency PRC) fly-back converter type SMPS (Switching Mode Power Supply) applications. This IC realizes high efficiency, low noise, downsizing and standardizing of a power supply system reducing external components count and simplifying the circuit designs.

(Note). PRC is abbreviation of "Pulse Ratio Control" (On-width control with fixed OFF-time).

Key Specifications

Type	MOSFET VDSS(V)	RDS(ON) MAX	AC input(V)	Pout(W) Note 1
IRIS-G6653	650	1.9 Ω	230 ± 15%	120
			85 to 264	58

Note1: The Pout (W) represents the thermal rating at Quasi-Resonant Operation, and the peak power output is obtained by approximately 120 to 140% of the above listed. When the output voltage is low and ON-duty is narrow, the Pout (W) shall become lower than that of above.

Absolute Maximum Ratings (Ta=25°C)

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to terminals stated, all currents are defined positive into any lead. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions.

*5 Maximum switching current.

The maximum switching current is the Drain current determined by the drive voltage of the IC and threshold voltage (Vth) of MOS FET. Therefore, in the event that voltage drop occurs between Pin 2 and Pin 3 due to patterning, the maximum switching current decreases as shown by V₂₋₃ in Fig.1 Accordingly please use this device within the decrease value, referring to the derating curve of the maximum switching current.
