## PRODUCT OVERVIEW

### SAM87 PRODUCT FAMILY

Samsung's SAM87 family of 8-bit single-chip CMOS microcontrollers offers a fast and efficient CPU, a wide range of integrated peripherals, and various mask-programmable ROM sizes. Important CPU features include:

- Efficient register-oriented architecture
- Selectable CPU clock sources
- Release of Idle and Stop power-down modes by interrupt
- Built-in basic timer circuit with watchdog function

A sophisticated interrupt structure recognizes up to eight interrupt levels. Each level can have one or more interrupt sources and vectors. Fast interrupt processing (within a minimum of six CPU clocks) can be assigned to specific interrupt levels.

### S3C8847/C8849/P8849 MICROCONTROLLERS

The S3C8847 microcontroller has a 24-Kbyte on-chip program memory and the S3C8849 has a 32-Kbyte. Both chips have a 272-byte general-purpose internal register file. The interrupt structure has nine interrupt sources with nine interrupt vectors. The CPU recognizes seven interrupt priority levels.

Using a modular design approach, the following peripherals were integrated with the SAM87 core to make the S3C8847/C8849/P8849 microcontrollers suitable for use in color television and other types of screen display applications:

- Four programmable I/O ports (26 pins total: 16 general-purpose I/O pins; 10 n-channel, open-drain output pins)
- 4-bit resolution A/D converter (4 channels)
- 14-bit PWM output (Two channels: push-pull type, open-drain type)
- Basic timer (BT) with watchdog timer function
- One 8-bit timer/counter (T0) with interval timer and PWM mode
- One 8-bit general-purpose timer/counter (TA) with prescalers
- On-screen display (OSD) with a wide range of programmable features, including halftone control signal output

The S3C8847 and the S3C8849 are available in versatile 42-pin SDIP package.

### OTP

The S3C8847/C8849 microcontrollers are also available in OTP (One Time Programmable) version, named the S3P8849. The S3P8849 microcontroller has an on-chip 32-Kbyte one-time-programmable EPROM instead of a masked ROM. The KS88P8432 is comparable to the S3C8847/C8849, both in function and pin configuration.

## S3P8849 OTP

### OVERVIEW

The S3P8849 single-chip CMOS microcontroller is the OTP (One Time Programmable) version of the S3C8847/C8849 microcontroller. It has an on-chip OTP ROM instead of a masked ROM. The EPROM is accessed by serial data format.

The S3P8849 is fully compatible with the S3C8847/C8849, both in function and pin configuration. The simple programming requirements of the S3P8849 make the device ideal for use as an evaluation chip for the S3C8847/C8849.
