Preface

Thank you very much for making use of Toshiba microcomputer LSIs.
Before use this LSI, refer the section, "Points of Note and Restrictions".
Especially, take care below cautions.

****CAUTION****

How to release the HALT mode

Usually, interrupts can release all halts status. However, the interrupts = ($\overline{\text{NMI}}$, INT0), which can release the HALT mode may not be able to do so if they are input during the period CPU is shifting to the HALT mode (for about 3 clocks of f_{FPH}) with IDLE1 or STOP mode (IDLE2/RUN are not applicable to this case). (In this case, an interrupt request is kept on hold internally.)

If another interrupt is generated after it has shifted to HALT mode completely, halt status can be released without difficulty. The priority of this interrupt is compare with that of the interrupt kept on hold internally, and the interrupt with higher priority is handled first followed by the other interrupt.

Low Voltage/Low Power

CMOS 16-Bit Microcontroller TMP93PS44F

1. Outline and Device Characteristics

The TMP93PS44 is OTP type MCU which includes 64-Kbyte one-time PROM. Using the adapter socket, you can write and verify the data for the TMP93PS44. The TMP93PS44 has the same pin assignment as TMP93CS44 (Mask ROM type).

Writing the program to built-in PROM, the TMP93PS44 operates as the same way as the TMP93CS44.

3. Operation

This section describes the functions and basic operational blocks of the TMP93PS44.

The TMP93PS44 has PROM in place of the mask ROM which is included in the TMP93CS44. The other configuration and functions are the same as the TMP93CS44. Regarding the function of the TMP93PS44 (Not described), see the part of TMP93CS44.

The TMP93PS44 has two operational modes: MCU mode and PROM mode.

3.1 MCU Mode

(1) Mode-setting and function

The MCU mode is set by opening the CLK pin (Pin open). In the MCU mode, the operation is same as TMP93CS44.

(2) Memory map

The memory map of TMP93PS44 is same as that of TMP93CS44. Figure 3.1.1 shows the memory map in MCU mode. Figure 3.1.2 show that in PROM mode.

Figure 3.1.1 Memory Map in MCU Mode

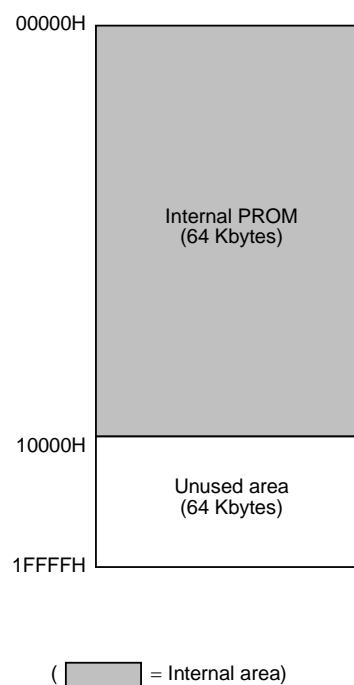

Figure 3.1.2 Memory Map in PROM Mode

3.2 PROM Mode

(1) Mode setting and function

PROM mode is set by setting the $\overline{\text{RESET}}$ and CLK pins to the “L” level. The programming and verification for the internal PROM is achieved by using a general EPROM programmer with the adaptor socket.

1. Preparation of OTP adaptor

BM11128: for TMP93PS44F

2. Setting of OTP adaptor

The switch (SW1) is set to N side.

3. Setting of PROM writer

i) Set PROM type to TC 571000D.

Size: 1 Mbits (128 K × 8 bits)

VPP: 12.75 V

tPW: 100 μs

Electric signature mode: None

ii) Data transmission

In TMP93PS44, PROM is placed on addresses 00000 to 0FFFFH in PROM mode, and addresses FF0000H to FFFFFFFH in MCU mode. Therefore data should be transferred to addresses 00000 to 0FFFFH in PROM mode using the object converter (tuconv) or the block transfer mode. (See instruction manual of PROM programmer.)

iii) Setting of the program address

Start address: 00000H

End address: 0FFFFH

Using PROM programmer which can not set the programming address, set FFH at addresses 10000H to 1FFFFH.

4. Programming

Program and verify according to operating process of PROM programmer.

Figure 3.2.1 shows the setting of the pins in PROM mode.

Figure 3.2.1 shows the setting of pins in PROM mode.

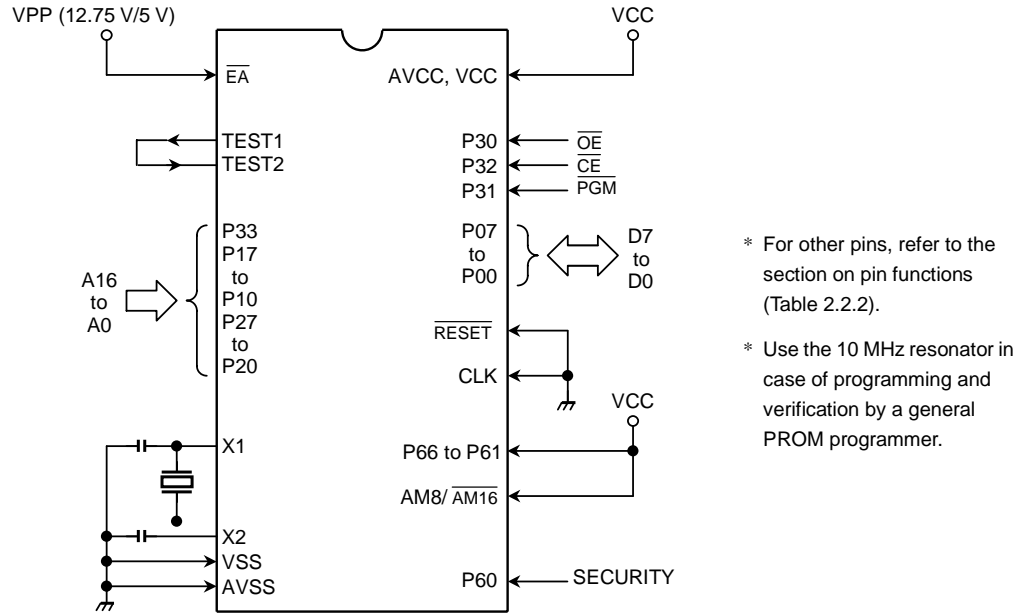

Figure 3.2.1 PROM Mode Pin Setting

(2) Caution for electric signature

The TMP93PS44 does not support the electric signature mode (Hereinafter referred to as “signature”). If PROM programmer used the signature, the device would be damaged because of applying voltage of 12 ± 0.5 V to pin 9 (A9) of the address.

Please use without setting the signature.

(3) Program mode

All bits of the TMP93PS44 are “1” when delivered (The erase state). Data “0” is written in the necessary bit location during program operating.

Writing function can be operated at $V_{PP} = 12.5$ V, $\overline{OE} = V_{IH}$, $\overline{CE} = V_{IL}$. Built-in one time PROM can be written in any sequence. It is possible to write only special address.

(4) Adopter socket (BM11128: for TMP93PS44)

BM11128 is the adapter sockets to write data into the TMP93PS44. The TMP93PS44 has built-in one time PROM using a general EPROM programmer.

(5) Program storing area of PROM mode

The TMP93PS44 has the program space (FF0000H to FFFFFFFH) of 64 Kbytes. The address 0000H to FFFFH of PROM mode equals to the address FF0000H to FFFFFFFH of MCU mode.

(6) Program write setting method using a general PROM programmer

PROM to be prepared should equal to TC571000D functions.

1. Set the switch (SW1) of BM11128 (hereinafter referred to as “adapter”) to the program side (NOR) (Note 1).
2. Connect MCU to the adapter (Note 2).
3. Connect the adapter to PROM programmer (Note 2).
4. Set the PROM type of PROM programmer to TC571000D.
5. Set the start address for writing PROM to 0000H, and the end address to FFFFH (Note 3).
6. Writing to built-in one time PROM and verifying should be operated according to the operation procedures of PROM programmer.

Note 1: If data is written to built-in one time PROM without setting the switch (SW1) to the program side, the device would be damaged.

Note 2: Please set with the first pin of the adapter and that of PROM programmer socket matched. If the first pin is conversely set, MCU or programmer would be damaged.

Note 3: If data “0” is written to the address which is over FFFFH, the contents of the original program would be damaged because of writing “0” to the addresses 0000H to FFFFH.

(7) Programming flow chart

The programming mode is set by applying 12.75 V (Programming voltage) to the VPP pin when the following pins are set as follows,

(VCC: 6.25 V, $\overline{\text{RESET}}$: “L” level, CLK: “L” level).

While address and data are fixed and $\overline{\text{CE}}$ pin is set to “L” level, 0.1 ms of “L” level pulse is applied to $\overline{\text{PGM}}$ pin to program the data.

Then the data in the address is verified.

If the programmed data is incorrect, another 0.1 ms pulse is applied to $\overline{\text{PGM}}$ pin.

This programming procedure is repeated until correct data is read from the address. (25 times maximum)

Subsequently, all data are programmed in all addresses.

The verification for all data is done under the condition of $V_{PP} = V_{CC} = 5\text{ V}$ after all data were written.

Figure 3.2.2 shows the programming flowchart.

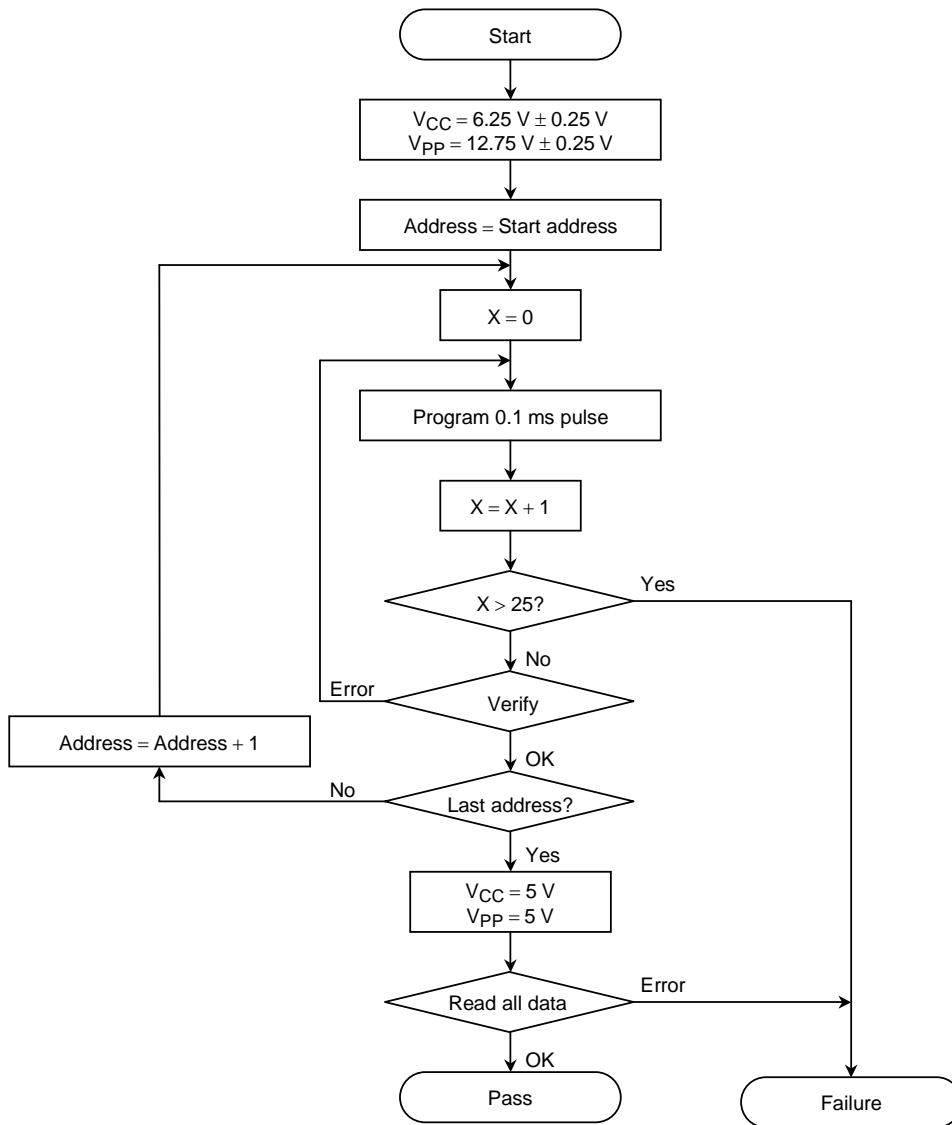

Figure 3.2.2 Flowchart (High-speed program writing)

(8) Security bit

The TMP93PS44 has a security bit in PROM cell.

If the security bit is programmed to “0”, the content of the PROM is disable to be read (FFH data) in PROM mode.

(How to program the security bit.)

The difference from the programming procedures described in section 3.2 (1) “Mode setting and function” are as follows.

1. Setting OTP adaptor

Set the switch (SW1) to S side.

2. Setting PROM programmer

i) Transferring the data

ii) Setting of programming address

The security bit is in bit0 of address 00000H.

Set the start address 00000H and the end address 00000H.

Set the data FEH at the address 00000H.

4. Electrical Characteristics

4.1 Maximum Ratings (TMP93PS44)

"X" used in an expression shows a cycle of clock f_{FPH} selected by SYSCR1<SYSCK>. If a clock gear or a low speed oscillator is selected, a value of "X" is different. The value as an example is calculated at f_c , gear = 1/ f_c (SYSCR1<SYSCK, GEAR2:0> = "0000").

Parameter	Symbol	Rating	Unit
Power supply voltage	V_{CC}	-0.5 to 6.5	V
Input voltage	V_{IN}	except \overline{EA} pin -0.5 to $V_{CC} + 0.5$ \overline{EA} pin -0.5 to 14.0	
Output current (Per 1 pin) P7	I_{OL1}	20	mA
Output current (Per 1 pin) except P7	I_{OL2}	2	
Output current (P7 total)	ΣI_{OL1}	80	
Output current (Total)	ΣI_{OL}	120	
Output current (Total)	ΣI_{OH}	-80	
Power dissipation ($T_a = 85^\circ\text{C}$)	P_D	350	mW
Soldering temperature (10 s)	T_{SOLDER}	260	$^\circ\text{C}$
Storage temperature	T_{STG}	-65 to 150	
Operating temperature	T_{OPR}	-40 to 85	

Note: The maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no maximum rating value will ever be exceeded.

(3) Read cycle

Note: Since the CPU accesses the internal area to read data from a port, the control signals of external pins such as \overline{RD} and \overline{CS} are not enabled. Therefore, the above waveform diagram should be regarded as depicting internal operation. Please also note that the timing and AC characteristics of port input/output shown above are typical representation. For details, contact your local Toshiba sales representative.

(4) Write cycle

Note: Since the CPU accesses the internal area to write data to a port, the control signals of external pins such as \overline{WR} and \overline{CS} are not enabled. Therefore, the above waveform diagram should be regarded as depicting internal operation.
