F²MC-16LX MB90480/485 Series

MB90F481/F482/487B/488B/483C MB90F488B/F489B/V480/V485B

■ DESCRIPTION

The MB90480/485 series is a 16-bit general-purpose FUJITSU microcontroller designed for process control in consumer devices and other applications requiring high-speed real-time processing.

The F²MC-16LX CPU core instruction set retains the AT architecture of the F²MC*¹ family, with additional instructions for high-level languages, expanded addressing mode, enhanced multiply-drive instructions, and complete bit processing. In addition, a 32-bit accumulator is provided to enable long-word processing.

The MB90480/485 series features embedded peripheral resources including 8/16-bit PPG, expanded I/O serial interface, UART, 10-bit A/D converter, 16-bit I/O timer, 8/16-bit up/down-counter, PWC timer, I²C*² interface, DTP/external interrupt, chip select, and 16-bit reload timer.

*1 : F²MC is the abbreviation for FUJITSU Flexible Microcontroller.

*2 : Purchase of Fujitsu I²C components conveys a license under the Philips I²C Patent Rights to use, these components in an I²C system provided that the system conforms to the I²C standard a Specification as defined by Philips.

■ FEATURES

- Clock
Minimum instruction execution time: 40.0 ns/6.25 MHz base frequency multiplied × 4 (25 MHz internal operating frequency/3.3 V ± 0.3 V)
62.5 ns/4 MHz base frequency multiplied × 4 (16 MHz internal operating frequency/3.0 V ± 0.3 V) PLL clock multiplier
- Maximum memory space: 16 Mbytes

(Continued)

Be sure to refer to the "Check Sheet" for the latest cautions on development.

"Check Sheet" is seen at the following support page

URL : <http://www.fujitsu.com/global/services/microelectronics/product/micom/support/index.html>

"Check Sheet" lists the minimal requirement items to be checked to prevent problems beforehand in system development.

MB90480/485 Series

(Continued)

- Instruction set optimized for controller applications
 - Supported data types (bit, byte, word, or long word)
 - Typical addressing modes (23 types)
 - 32-bit accumulator for enhanced high-precision calculation
 - Enhanced signed multiplication/division instruction and RETI instruction functions
- Instruction set designed for high-level programming language (C) and multi-task operations
 - System stack pointer adopted
 - Instruction set symmetry and barrel shift instructions
- Non-multiplex bus/multiplex bus compatible
- Enhanced execution speed
 - 4-byte instruction queue
- Enhanced interrupt functions
 - 8 levels setting with programmable priority, 8 external interrupts
- Data transfer function (μ DMAC)
 - Up to 16 channels
- Embedded ROM
 - Flash versions : 192 Kbytes, 256 Kbytes, 384 Kbytes, MASK versions : 192 Kbytes, 256 Kbytes
- Embedded RAM
 - Flash versions : 4 Kbytes, 6 Kbytes, 10 Kbytes, 24 Kbytes, MASK versions : 10 Kbytes, 16 Kbytes
- General purpose ports
 - Up to 84 ports
 - (Includes 16 ports with input pull-up resistance settings, 16 ports with output open-drain settings)
- A/D converter
 - 8-channel RC sequential comparison type (10-bit resolution, 3.68 μ s conversion time (at 25 MHz))
- I²C interface (MB90485 series only) : 1channel, P76/P77 N-ch open drain pin (without P-ch)
 - Do not apply high voltage in excess of recommended operating ranges to the N-ch open drain pin (with P-ch) in MB90V485B.
- μ PG (MB90485 series only) : 1 channel
- UART : 1 channel
- Extended I/O serial interface (SIO) : 2 channels
- 8/16-bit PPG : 3 channels (with 8-bit \times 6 channel/16-bit \times 3 channel mode switching function)
- 8/16-bit up/down counter/timer: 1 channel (with 8-bit \times 2 channels/16-bit \times 1-channel mode switching function)
- PWC (MB90485 series only) : 3 channels (Capable of compare the inputs to two of the three)
- 3 V/5 V I/F pin (MB90485 series only)
 - P20 to P27, P30 to P37, P40 to P47, P70 to P77
- 16-bit reload timer : 1 channel
- 16-bit I/O timer : 2 channels input capture, 6 channels output compare, 1 channel free run timer
- On chip dual clock generator system
- Low-power consumption mode
 - With stop mode, sleep mode, CPU intermittent operation mode, watch mode, timebase timer mode
- Packages : QFP 100/LQFP 100
- Process : CMOS technology
- Power supply voltage : 3 V, single power supply (some ports can be operated by 5 V power supply at MB90485 series)

MB90480/485 Series

■ PRODUCT LINEUP

• MB90480 series

Part number		MB90F481	MB90F482	MB90V480
Item				
Classification		Flash memory product		Evaluation product
ROM size		192 Kbytes	256 Kbytes	—
RAM size		4 Kbytes	6 Kbytes	16 Kbytes
CPU function		Number of instructions : 351 Instruction bit length : 8-bit, 16-bit Instruction length : 1 byte to 7 bytes Data bit length : 1-bit, 8-bit, 16-bit Minimum instruction execution time : 40 ns (25 MHz machine clock)		
Ports		General-purpose I/O ports: up to 84 General-purpose I/O ports (CMOS output) General-purpose I/O ports (with pull-up resistance) General-purpose I/O ports (N-ch open drain output)		
UART		1 channel, start-stop synchronized		
8/16-bit PPG		8-bit × 6 channels/16-bit × 3 channels		
8/16-bit up/down counter/timer		Event input pins : 6, 8-bit up/down counters : 2 8-bit reload/compare registers : 2		
16-bit I/O timers	16-bit free run timer	Number of channels : 1 Overflow interrupt		
	Output compare (OCU)	Number of channels : 6 Pin input factor : A match signal of compare register		
	Input capture (ICU)	Number of channels : 2 Rewriting a register value upon a pin input (rising, falling, or both edges)		
DTP/external interrupt circuit		Number of external interrupt pin channels : 8 (edge or level detection)		
Extended I/O serial interface		Embedded 2 channels		
Timebase timer		18-bit counter Interrupt cycles: 1.0 ms, 4.1 ms, 16.4 ms, 131.1 ms (at 4 MHz base oscillator)		
A/D converter		Conversion resolution : 8/10-bit, switchable One-shot conversion mode (converts selected channel 1 time only) Scan conversion mode (conversion of multiple consecutive channels, programmable up to 8 channels) Continuous conversion mode (repeated conversion of selected channels) Stop conversion mode (conversion of selected channels with repeated pause)		
Watchdog timer		Reset generation interval : 3.58 ms, 14.33 ms, 57.23 ms, 458.75 ms (minimum value, at 4 MHz base oscillator)		
Low-power consumption (standby) modes		Stop mode, sleep mode, CPU intermittent operation mode, watch timer mode, timebase timer mode		
Process		CMOS		
Type		Not included security function		User pin*1, 3 V/5 V versions
Emulator power supply*2		—		Included

*1 : User pin : P20 to P27, P30 to P37, P40 to P47, P70 to P77

*2 : It is setting of Jumper switch (TOOL VCC) when emulator (MB2147-01) is used.
Please refer to the MB2147-01 or MB2147-20 hardware manual (3.3 Emulator-dedicated Power Supply switching) about details.

Note : Ensure that you must write to Flash at $V_{CC} = 3.13 \text{ V to } 3.60 \text{ V}$ ($3.3 \text{ V} + 10\%, -5\%$).

Emulator power supply*3	—	—	—	Included	—	—

*1 : 3 V/5 V I/F pin : All pins should be for 3 V power supply without P20 to P27, P30 to P37, P40 to P47, and P70 to P77.

*2 : P76/P77 pins are N-ch open drain pins (without P-ch) at built-in I²C. However, MB90V485B uses the N-ch open drain pin (with P-ch) .

*3 : It is setting of Jumper switch (TOOL VCC) when emulator (MB2147-01) is used.
Please refer to the MB2147-01 or MB2147-20 hardware manual (3.3 Emulator-dedicated Power Supply Switching) about details.

Notes : • As for MB90V485B, input pins (PWC0, PWC1, PWC2/EXTC/SCL and SDA pins) for PWC/ μ PG/I²C become CMOS input.
• Ensure that you must write to Flash at $V_{CC} = 3.13 \text{ V to } 3.60 \text{ V}$ ($3.3 \text{ V} + 10\%, - 5\%$) .

(TOP VIEW)

(FPT-100P-M05)

* : These are the pins for MB90485 series. The pins for MB90480 series are P36/A06, P37/A07, P43/A11, P44/A12, P45/A13, P75 to P77.

Note : MB90485 series only

- I²C pin P77 and P76 are N-ch open drain pin (without P-ch) . However, MB90V485B uses the N-ch open drain pin (with P-ch) .
- P20 to P27, P30 to P37, P40 to P47 and P70 to P77 are also used as 3 V/5 V I/F pin.
- As for MB90V485B, input pins (PWC0, PWC1, PWC2/EXTC/SCL and SDA pins) for PWC/ μ PG/I²C become CMOS input.

MB90480/485 Series

■ PIN DESCRIPTIONS

Pin No.		Pin name	I/O circuit type*3	Function
QFP*1	LQFP*2			
82	80	X0	A	Clock (oscillator) input pin
83	81	X1	A	Clock (oscillator) output pin
80	78	X0A	A	Clock (32 kHz oscillator) input pin
79	77	X1A	A	Clock (32 kHz oscillator) output pin
77	75	$\overline{\text{RST}}$	B	Reset input pin
85 to 92	83 to 90	P00 to P07	C (CMOS)	This is a general purpose I/O port. A setting in the port 0 input resistance register (RDR0) can be used to apply pull-up resistance (RD00-RD07 = "1") . (Disabled when pin is set for output.)
		AD00 to AD07		In multiplex mode, these pins function as the external address/data bus low I/O pins.
		D00 to D07		In non-multiplex mode, these pins function as the external data bus low output pins.
93 to 100	91 to 98	P10 to P17	C (CMOS)	This is a general purpose I/O port. A setting in the port 1 input resistance register (RDR1) can be used to apply pull-up resistance (RD10-RD17 = "1") . (Disabled when pin is set for output.)
		AD08 to AD15		In multiplex mode, these pins function as the external address/data bus high I/O pins.
		D08 to D15		In non-multiplex mode, these pins function as the external data bus high output pins.
1 to 4	99, 100, 1, 2	P20 to P23	E (CMOS/H)	This is a general purpose I/O port. When the bits of external address output control register (HACR) are set to "1" in external bus mode, these pins function as general purpose I/O ports.
		A16 to A19		When the bits of external address output control register (HACR) are set to "0" in multiplex mode, these pins function as address high output pins (A16-A19). When the bits of external address output control register (HACR) are set to "0" in non-multiplex mode, these pins function as address high output pins (A16-A19).
5 to 8	3 to 6	P24 to P27	E (CMOS/H)	This is a general purpose I/O port. When the bits of external address output control register (HACR) are set to "1" in external bus mode, these pins function as general purpose I/O ports.
		A20 to A23		When the bits of external address output control register (HACR) are set to "0" in multiplex mode, these pins function as address high output pins (A20-A23). When the bits of external address output control register (HACR) are set to "0" in non-multiplex mode, these pins function as address high output pins (A20-A23).
		PPG0 to PPG3		Output pins for PPG.
9	7	P30	E (CMOS/H)	This is a general purpose I/O port.
		A00		In non-multiplex mode, this pin functions as an external address pin.
		AIN0		8/16-bit up/down timer input pin (ch.0) .

Pin No.		Pin name	I/O circuit type*3	Function		
QFP*1	LQFP*2					
10	8	P31	E (CMOS/H)	This is a general purpose I/O port.		
		A01		In non-multiplex mode, this pin functions as an external address pin.		
		BIN0		8/16-bit up/down timer input pin (ch.0) .		
12	10	P32	E (CMOS/H)	This is a general purpose I/O port.		
		A02		In non-multiplex mode, this pin functions as an external address pin.		
		ZIN0		8/16-bit up/down timer input pin (ch.0)		
13	11	P33	E (CMOS/H)	This is a general purpose I/O port.		
		A03		In non-multiplex mode, this pin functions as an external address pin.		
		AIN1		8/16-bit up/down timer input pin (ch.1) .		
14	12	P34	E (CMOS/H)	This is a general purpose I/O port.		
		A04		In non-multiplex mode, this pin functions as an external address pin.		
		BIN1		8/16-bit up/down timer input pin (ch.1) .		
15	13	P35	E (CMOS/H)	This is a general purpose I/O port.		
		A05		In non-multiplex mode, this pin functions as an external address pin.		
		ZIN1		8/16-bit up/down timer input pin (ch.1)		
16, 17	14, 15	P36, P37	D (CMOS)	MB90480 series	This is a general purpose I/O port.	
		A06, A07			In non-multiplex mode, this pin functions as an external address pin.	
		P36, P37	E (CMOS/H)	MB90485 series	This is a general purpose I/O port.	
		A06, A07			In non-multiplex mode, this pin functions as an external address pin.	
		PWC0, PWC1*4			This is a PWC input pin.	
18	16	P40	G (CMOS/H)	This is a general purpose I/O port.		
		A08		In non-multiplex mode, this pin functions as an external address pin.		
		SIN2		Extended I/O serial interface input pin.		
19	17	P41	F (CMOS)	This is a general purpose I/O port.		
		A09		In non-multiplex mode, this pin functions as an external address pin.		
		SOT2		Extended I/O serial interface output pin.		
20	18	P42	G (CMOS/H)	This is a general purpose I/O port.		
		A10		In non-multiplex mode, this pin functions as an external address pin.		
		SCK2		Extended I/O serial interface clock input/output pin.

MB90480/485 Series

Pin No.		Pin name	I/O circuit type*3	Function	
QFP*1	LQFP*2				
21, 22	19, 20	P43, P44	F (CMOS)	MB90480 series	This is a general purpose I/O port.
		A11, A12			In non-multiplex mode, this pin functions as an external address pin.
		P43, P44	F (CMOS)	MB90485 series	This is a general purpose I/O port.
		A11, A12			In non-multiplex mode, this pin functions as an external address pin.
		MT00, MT01			μPG output pin.
24	22	P45	F (CMOS)	MB90480 series	This is a general purpose I/O port.
		A13			In non-multiplex mode, this pin functions as an external address pin.
		P45	G (CMOS/H)	MB90485 series	This is a general purpose I/O port.
		A13			In non-multiplex mode, this pin functions as an external address pin.
		EXTC*4			μPG input pin.
25, 26	23, 24	P46, P47	F (CMOS)		This is a general purpose I/O port.
		A14, A15			In non-multiplex mode, this pin functions as an external address pin.
		OUT4/OUT5			Output compare event output pins.
70	68	P50	D (CMOS)		This is a general purpose I/O port. In external bus mode, this pin functions as the ALE pin.
		ALE			In external bus mode, this pin functions as the address load enable (ALE) signal pin.
71	69	P51	D (CMOS)		This is a general purpose I/O port. In external bus mode, this pin functions as the RD pin.
		\overline{RD}			In external bus mode, this pin functions as the read strobe output (\overline{RD}) signal pin.
72	70	P52	D (CMOS)		This is a general purpose I/O port. In external bus mode, when the WRE bit in the EPCR register is set to "1", this pin functions as the \overline{WRL} pin.
		\overline{WRL}			In external bus mode, this pin functions as the lower data write strobe output (\overline{WRL}) pin. When the WRE bit in the EPCR register is set to "0", this pin functions as a general purpose I/O port.
73	71	P53	D (CMOS)		This is a general purpose I/O port. In external bus mode with 16-bit bus width, when the WRE bit in the EPCR register is set to "1", this pin functions as the \overline{WRH} pin.
		\overline{WRH}			In external bus mode with 16-bit bus width, this pin functions as the upper data write strobe output (\overline{WRH}) pin. When the WRE bit in the EPCR register is set to "0", this pin functions as a general purpose I/O port.

Pin No.		Pin name	I/O circuit type ^{*3}	Function
QFP ^{*1}	LQFP ^{*2}			
74	72	P54	D (CMOS)	This is a general purpose I/O port. In external bus mode, when the HDE bit in the EPCR register is set to "1", this pin functions as the HRQ pin.
		HRQ		In external bus mode, this pin functions as the hold request input (HRQ) pin. When the HDE bit in the EPCR register is set to "0", this pin functions as a general purpose I/O port.
75	73	P55	D (CMOS)	This is a general purpose I/O port. In external bus mode, when the HDE bit in the EPCR register is set to "1", this pin functions as the $\overline{\text{HAK}}$ pin.
		$\overline{\text{HAK}}$		In external bus mode, this pin functions as the hold acknowledge output (HAK) pin. When the HDE bit in the EPCR register is set to "0", this pin functions as a general purpose I/O port.
76	74	P56	D (CMOS)	This is a general purpose I/O port. In external bus mode, when the RYE bit in the EPCR register is set to "1", this pin functions as the RDY pin.
		RDY		In external bus mode, this pin functions as the external ready (RDY) input pin. When the RYE bit in the EPCR register is set to "0", this pin functions as a general purpose I/O port.
78	76	P57	D (CMOS)	This is a general purpose I/O port. In external bus mode, when the CKE bit in the EPCR register is set to "1", this pin functions as the CLK pin.
		CLK		In external bus mode, this pin functions as the machine cycle clock (CLK) output pin. When the CKE bit in the EPCR register is set to "0", this pin functions as a general purpose I/O port.
38 to 41	36 to 39	P60 to P63	H (CMOS)	These are general purpose I/O ports.
		AN0 to AN3		These are the analog input pins for A/D converter.
43 to 46	41 to 44	P64 to P67	H (CMOS)	These are general purpose I/O ports.
		AN4 to AN7		These are the analog input pins for A/D converter.
27	25	P70	G (CMOS/H)	This is a general purpose I/O port.
		SIN0		This is the UART serial data input pin.
28	26	P71	F (CMOS)	This is a general purpose I/O port.
		SOT0		This is the UART serial data output pin.
29	27	P72	G (CMOS/H)	This is a general purpose I/O port.
		SCK0		This is the UART serial communication clock I/O pin.
30	28	P73	G (CMOS/H)	This is a general purpose I/O port.
		TIN0		This is the 16-bit reload timer event input pin.
31	29	P74	F (CMOS)	This is a general purpose I/O port.
		TOT0		This is the 16-bit reload timer output pin.

66 to 69	64 to 67	PA0 to PA3	D (CMOS)	These are general purpose I/O ports.
		OUT0 to OUT3		Output compare event output pins.
35	33	AV _{CC}	—	A/D converter analog power supply input pin.
36	34	AV _{RH}	—	A/D converter reference voltage input pin.
37	35	AV _{SS}	—	A/D converter GND pin.
49 to 51	47 to 49	MD0 to MD2	J (CMOS/H)	Operating mode selection input pins.
84	82	V _{CC3}	—	3.3 V ± 0.3 V power supply pins (V _{CC3}) .
23	21	V _{CC5}	—	MB90480 series 3.3 V ± 0.3 V power supply pin. Usually, use V _{CC} = V _{CC3} = V _{CC5} as a 3 V power supply.
				MB90485 series 3 V/5 V power supply pin. 5 V power supply pin when P20 to P27, P30 to P37, P40 to P47, P70 to P77 are used as 5 V I/F pins. Usually, use V _{CC} = V _{CC3} = V _{CC5} as a 3 V power supply (when the 3 V power supply is used alone) .
11, 42, 81	9, 40, 79	V _{SS}	—	GND pins.

*1 : QFP : FPT-100P-M06

*2 : LQFP : FPT-100P-M05

*3 : For the I/O circuit type, refer to “■ I/O CIRCUIT TYPES”.

*4 : As for MB90V485B, input pins become CMOS input.

MB90480/485 Series

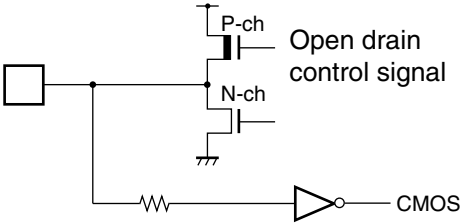

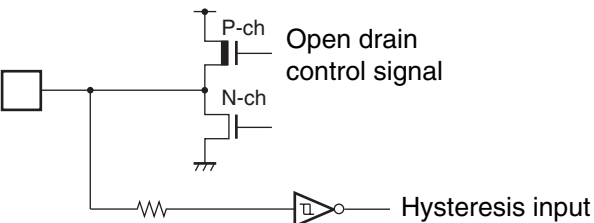

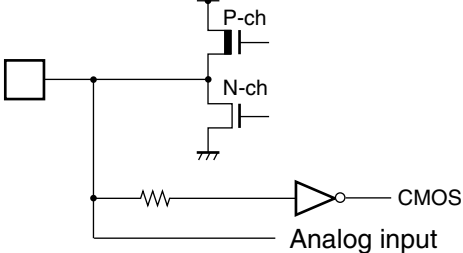

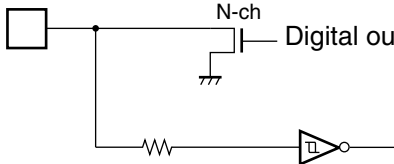

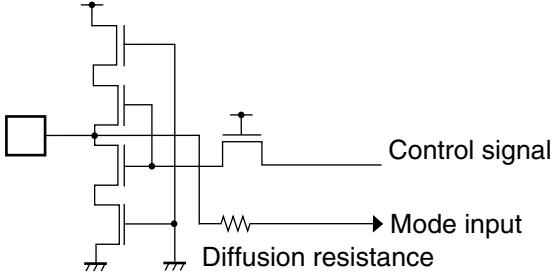

I/O CIRCUIT TYPES

Type	Circuit	Remarks
A		<ul style="list-style-type: none"> • Feedback resistance X1, X0 : approx. 1 MΩ X1A, X0A : approx. 10 MΩ • With standby control
B		Hysteresis input with pull-up resistance
C		<ul style="list-style-type: none"> • With input pull-up resistance control • CMOS level input/output
D		CMOS level input/output
E		<ul style="list-style-type: none"> • Hysteresis input • CMOS level output

■ HANDLING DEVICES

1. Be careful never to exceed maximum rated voltages (preventing latch-up)

In CMOS IC devices, a condition known as latch-up may occur if voltages higher than V_{CC} or lower than V_{SS} are applied to input or output pins other than medium-or high-voltage pins, or if the voltage applied between V_{CC} and V_{SS} pins exceeds the rated voltage level.

When latch-up occurs, the power supply current increases rapidly causing the possibility of thermal damage to circuit elements. Therefore it is necessary to ensure that maximum ratings are not exceeded in circuit operation. Similarly, when turning the analog power supply on or off, it is necessary to ensure that the analog power supply voltages (AV_{CC} and AV_{RH}) and analog input voltages do not exceed the digital power supply (V_{CC}) .

2. Treatment of unused pins

Leaving unused input pins unconnected can cause abnormal operation or latch-up, leading to permanent damage. Unused input pins should always be pulled up or down through resistance of at least 2 k Ω . Any unused input/output pins may be set to output mode and left open, or set to input mode and treated the same as unused input pins.

3. Treatment of Power Supply Pins (V_{CC}/V_{SS})

When multiple V_{CC}/V_{SS} pins are present, device design considerations for prevention of latch-up and unwanted electromagnetic interference, abnormal strobe signal operation due to ground level rise, and conformity with total output current ratings require that all power supply pins must be externally connected to power supply or ground.

Consideration should be given to connecting power supply sources to the V_{CC}/V_{SS} pins of this device with as low impedance as possible. It is also recommended that a bypass capacitor of approximately 0.1 μ F be placed between the V_{CC} and V_{SS} lines as close to this device as possible.

4. Crystal Oscillator Circuits

Noise around the X0/X1, or X0A/X1A pins may cause this device to operate abnormally. In the interest of stable operation it is strongly recommended that printed circuit board artwork places ground bypass capacitors as close as possible to the X0/X1, X0A/X1A and crystal oscillator (or ceramic oscillator) and that oscillator lines do not cross the lines of other circuits.

5. Precautions when turning the power supply on

In order to prevent abnormal operation in the chip's internal step-down circuits, a voltage rise time during power-on of 50 μ s (0.2 V to 2.7 V) or greater should be assured.

6. Supply Voltage Stabilization

Even within the operating range of V_{CC} supply voltage, rapid voltage fluctuations may cause abnormal operation. As a standard for power supply voltage stability, it is recommended that the peak-to-peak V_{CC} ripple voltage at commercial supply frequency (50 MHz to 60 MHz) be 10 % or less of V_{CC} , and that the transient voltage fluctuation be no more than 0.1 V/ms or less when the power supply is turned on or off.

7. Proper power-on/off sequence

The A/D converter power (AV_{CC} , AV_{RH}) and analog input (AN0 to AN7) must be turned on after the digital power supply (V_{CC}) is turned on. The A/D converter power (AV_{CC} , AV_{RH}) and analog input (AN0 to AN7) must be shut off before the digital power supply (V_{CC}) is shut off. Care should be taken that AV_{RH} does not exceed AV_{CC} . Even when pins used as analog input pins are doubled as input ports, be sure that the input voltage does not exceed AV_{CC} .

8. Treatment of power supply pins on models with A/D converters

Even when the A/D converters are not in use, be sure to make the necessary connections $AV_{CC} = AVRH = V_{CC}$, and $AV_{SS} = V_{SS}$.

9. Notes on Using Power Supply

Only the MB90485 series usually uses a 3 V power supply. By setting $V_{CC3} = 3$ V power supply and $V_{CC5} = 5$ V power supply, P20 to P27, P30 to P37, P40 to P47 and P70 to P77 can be interfaced as 5 V power supplies separately from the main 3 V power supply. Note that the analog power supplies (such as AV_{CC} and AV_{SS}) for the A/D converter can be used only as 3 V power supplies.

10. Notes on Using External Clock

Even when using an external clock signal, an oscillation stabilization delay is applied after a power-on reset or when recovering from sub-clock or stop mode. When using an external clock, 25 MHz should be the upper frequency limit.

The following figure shows a sample use of external clock signals.

11. Treatment of NC pins

NC (internally connected) pins should always be left open.

12. Notes on during operation of PLL clock mode

On this microcontroller, if in case the crystal oscillator breaks off or an external reference clock input stops while the PLL clock mode is selected, a self-oscillator circuit contained in the PLL may continue its operation at its self-running frequency. However, Fujitsu will not guarantee results of operation if such failure occurs.

13. When the MB90480/485 series microcontroller is used as a single system

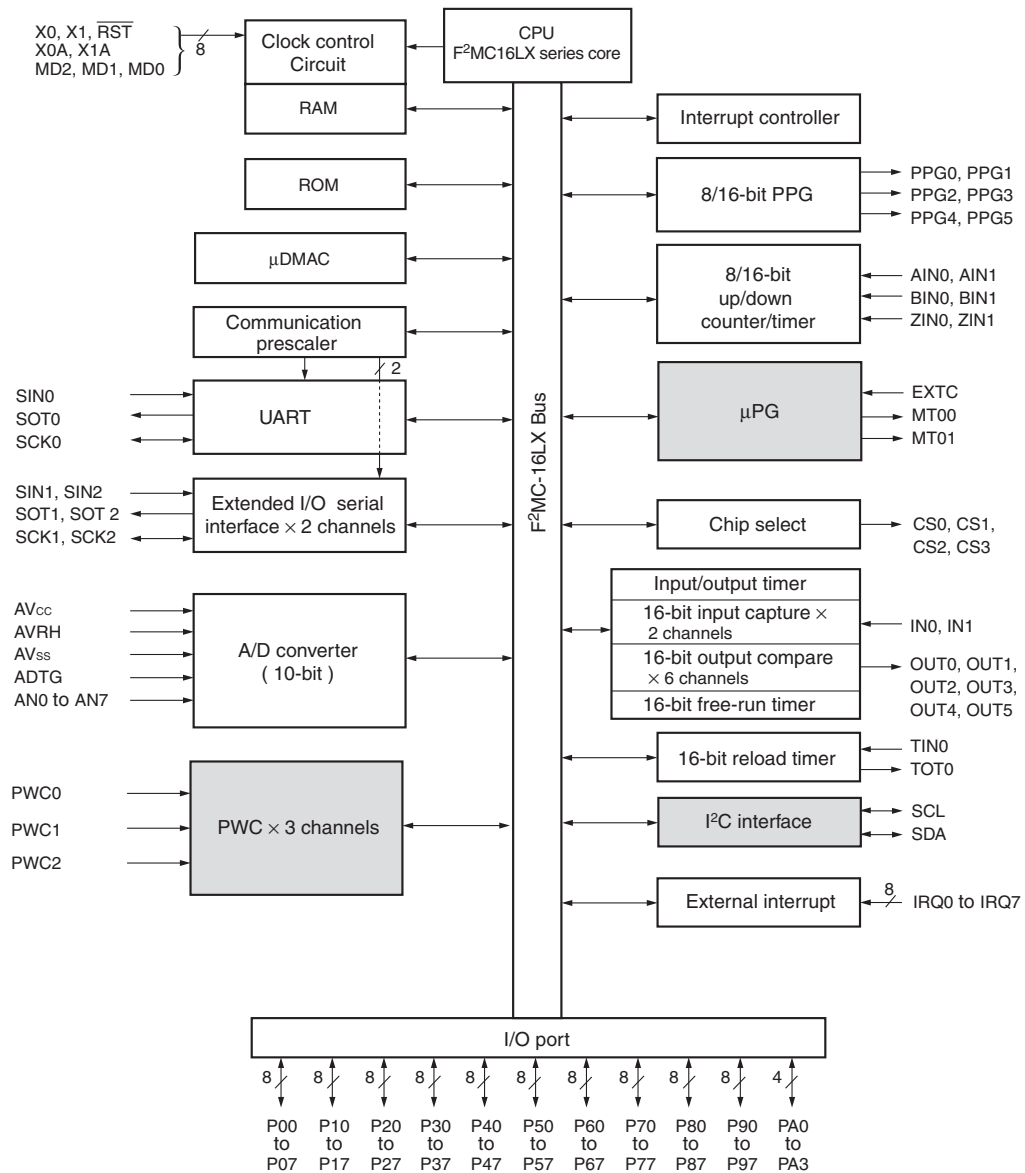

When the MB90480/485 series microcontroller is used as a single system, use connections so the $X0A = V_{SS}$, and $X1A = \text{Open}$.

14. Writing to Flash memory

For writing to Flash memory, always ensure that the operating voltage V_{CC} is between 3.0 V and 3.6 V.

MB90480/485 Series

■ BLOCK DIAGRAM

 : Only MB90485 series

P00 to P07 (8 pins) : with an input pull-up resistance setting register.

P10 to P17 (8 pins) : with an input pull-up resistance setting register.

P40 to P47 (8 pins) : with an open drain setting register.

P70 to P77 (8 pins) : with an open drain setting register.

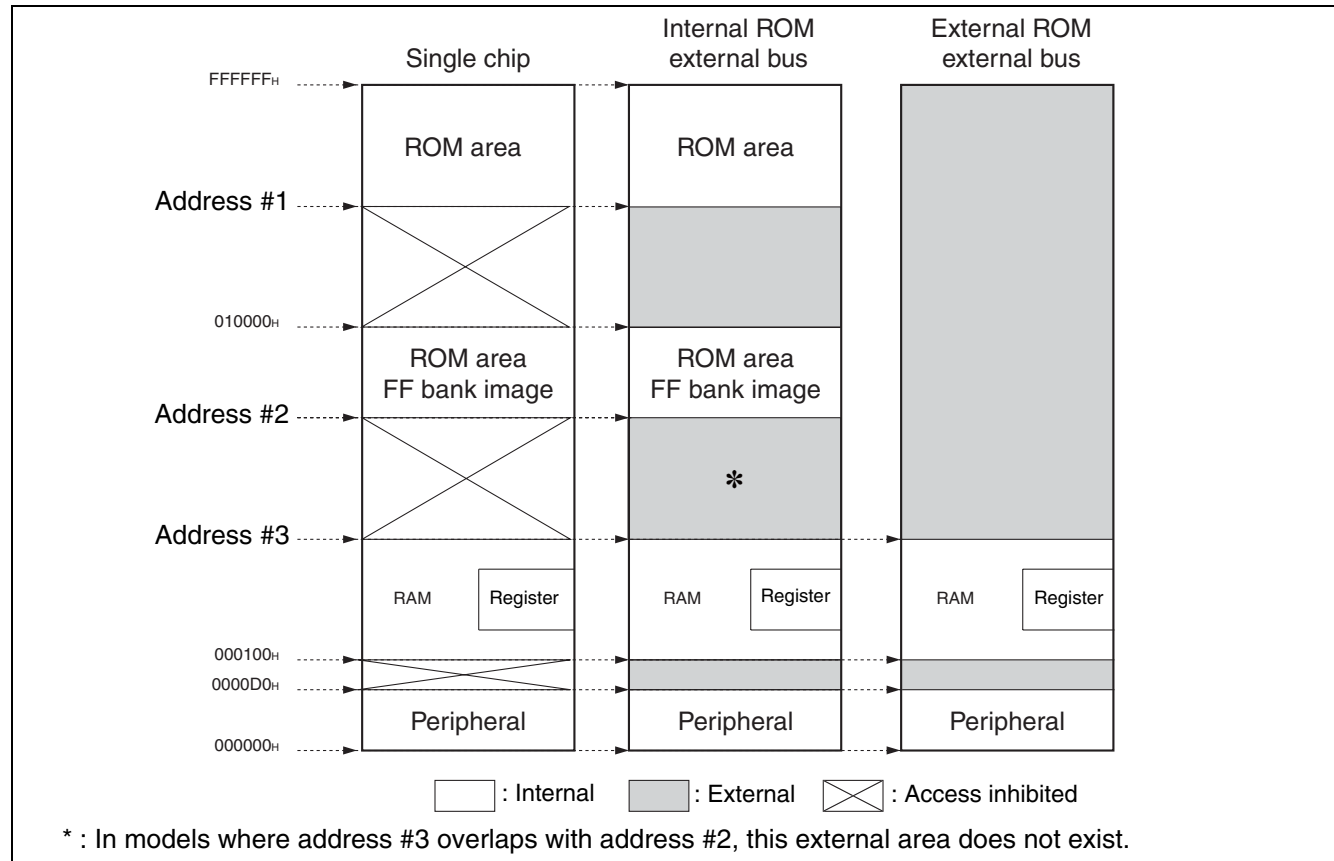

MB90485 series only

- I²C pin P77 and P76 are N-ch open drain pin (without P-ch) . However, MB90V485B uses the N-ch open drain pin (with P-ch) .
- P20 to P27, P30 to P37, P40 to P47 and P70 to P77 are also used as 3 V/5 V I/F pin.
- As for MB90V485B, input pins (PWC0, PWC1, PWC2/EXTC/SCL and SDA pins) for PWC/μPG/I²C become CMOS input.

Note : In the above diagram, I/O ports share internal function blocks and pins. However, when a set of pins is used with an internal module, it cannot also be used as an I/O port.

MEMORY MAP

• MB90F481/F482/487B/488B/483C/F488B/V480/V485B/F489B

Model	Address #1	Address #2	Address #3
MB90F481	FC0000H ^{*1}	004000H or 008000H, selected by the MS bit in the ROMM register	001100H
MB90F482	FC0000H		001900H
MB90487B	FD0000H		002900H
MB90488B	FC0000H		002900H
MB90F488B	FC0000H		002900H
MB90V480	(FC0000H)		004000H
MB90V485B	(FC0000H)		004000H
MB90483C	FB0000H ^{*4}		004000H
MB90F489B	F90000H ^{*2}	0080000H fixed	006100H ^{*3}

^{*1} : No memory cells from FC0000H to FC7FFFH and FE0000H to FE7FFFH.

The upper part of the 00 bank is set up to mirror the image of FF bank ROM, to enable efficient use of small model C compilers. Because the lower 16-bit address of the FF bank and the lower 16-bit address of the 00 bank are the same, enabling reference to tables in ROM without using the for specification in the pointer declaration.

For example, in accessing address 00C000H it is actually the contents of ROM at FFC000H that are accessed. If the MS bit in the ROMM register is set to "0", the ROM area in the FF bank will exceed 48 Kbytes and it is not possible to reflect the entire area in the image in the 00 bank. Therefore the image from FF4000H to FFFFFFFH is reflected in the 00 bank and the area from FF0000H to FF3FFFH can be seen in the FF bank only.

Descriptions for read/write

R/W : Readable and writable

R : Read only

W : Write only

Descriptions for initial value

0 : The initial value of this bit is "0".

1 : The initial value of this bit is "1".

X : The initial value of this bit is undefined.

- : This bit is not used.

* : The initial value of this bit is "1" or "0".

The value depends on the mode pin (MD2, MD1 and MD0) .

+ : The initial value of this bit is "1" or "0".

The value depends on the RAM area of device.

Interrupt source	Clear of EI ² OS	μDMAC channel number	Interrupt vector		Interrupt control register	
			Number	Address	Number	Address
I ² C interface (MB90485 series only)	×	×	#39	FFFF60 _H	ICR14	0000BE _H
A/D conversion	○	15	#40	FFFF5C _H		
Flash write/erase, timebase timer, watch timer *1	×	×	#41	FFFF58 _H	ICR15	0000BF _H
Delay interrupt generator module	×	×	#42	FFFF54 _H		

× : Interrupt request flag is not cleared by the interrupt clear signal.

○ : Interrupt request flag is cleared by the interrupt clear signal.

◎ : Interrupt request flag is cleared by the interrupt clear signal (stop request present) .

*1 : The Flash write/erase, timebase timer, and watch timer cannot be used at the same time.

*2 : When the 16-bit reload timer underflow interrupt is changed from enable (TMCSR : INTE = 1) to disable (TMCSR : INTE = 0) , disable the interrupt in the interrupt control register (ICR12 : IL2 to 0 : 111_B) , then set the INTE bit to 0.

Note : If there are two interrupt sources for the same interrupt number, the resource will clear both interrupt request flags at the EI²OS/μDMAC interrupt clear signal. Therefore if either of the two sources uses the EI²OS/μDMAC function, the other interrupt function cannot be used. The interrupt request enable bit for the corresponding resource should be set to “0” and interrupt requests from that resource should be handled by software polling.

■ PERIPHERAL RESOURCES

1. I/O Ports

The I/O ports perform the functions of either sending data from the CPU to the I/O pins, or loading information from the I/O into the CPU, according to the setting of the corresponding port data register (PDR). The input/output direction of each I/O pin can be set in individual bit units by the port direction register (DDR) for each I/O port.

The MB90480/485 series has 84 input/output pins. The I/O ports are port 0 through port A.

(1) Port Data Registers

PDR	7	6	5	4	3	2	1	0	Initial value	Access
PDR0 Address : 000000H	P07	P06	P05	P04	P03	P02	P01	P00	Undefined	R/W*1
PDR1 Address : 000001H	P17	P16	P15	P14	P13	P12	P11	P10	Undefined	R/W*1
PDR2 Address : 000002H	P27	P26	P25	P24	P23	P22	P21	P20	Undefined	R/W*1
PDR3 Address : 000003H	P37	P36	P35	P34	P33	P32	P31	P30	Undefined	R/W*1
PDR4 Address : 000004H	P47	P46	P45	P44	P43	P42	P41	P40	Undefined	R/W*1
PDR5 Address : 000005H	P57	P56	P55	P54	P53	P52	P51	P50	Undefined	R/W*1
PDR6 Address : 000006H	P67	P66	P65	P64	P63	P62	P61	P60	Undefined	R/W*1
PDR7 Address : 000007H	P77	P76	P75	P74	P73	P72	P71	P70	Undefined*2	R/W*1
PDR8 Address : 000008H	P87	P86	P85	P84	P83	P82	P81	P80	Undefined	R/W*1
PDR9 Address : 000009H	P97	P96	P95	P94	P93	P92	P91	P90	Undefined	R/W*1
PDRA Address : 00000AH	—	—	—	—	PA3	PA2	PA1	PA0	Undefined	R/W*1

*1 : The R/W indication for I/O ports is somewhat different than R/W access to memory, and involves the following operations.

- Input mode
 - Read : Reads the corresponding signal pin level.
 - Write : Writes to the output latch.
- Output mode
 - Read : Reads the value from the data register latch.
 - Write : Outputs the value to the corresponding signal pin.

*2 : The initial value of this bit is "11XXXXXX_B" on MB90485 series.

MB90480/485 Series

(2) Port Direction Registers

Register	7	6	5	4	3	2	1	0	Initial value	Access
DDR0 Address : 000010 _H	D07	D06	D05	D04	D03	D02	D01	D00	00000000 _B	R/W

DDR6 Address : 000016 _H	D67	D66	D65	D64	D63	D62	D61	D60	00000000 _B	R/W
DDR7 Address : 000017 _H	D77*1	D76*1	D75	D74	D73	D72	D71	D70	00000000 _B *2	R/W
DDR8 Address : 000018 _H	D87	D86	D85	D84	D83	D82	D81	D80	00000000 _B	R/W
DDR9 Address : 000019 _H	D97	D96	D95	D94	D93	D92	D91	D90	00000000 _B	R/W
DDRA Address : 00001A _H	—	—	—	—	DA3	DA2	DA1	DA0	----0000 _B	R/W

*1 : The value is set to “—” on MB90485 series only.

*2 : The initial value of this bit is “XX000000_B” on MB90485 series only.

- When a set of pins is functioning as a port, the corresponding signal pins are controlled as follows.
 - 0 : Input mode.
 - 1 : Output mode. Reset to “0”.

Notes : • When any of these registers are accessed using a read-modify-write type instruction (such as a bit set instruction), the bit specified in the instruction will be set to the indicated value. However, the contents of output registers corresponding to any other bits having input settings will be rewritten to the input values of those pins at that time.

For this reason, when changing any pin that has been used for input to output, first write the desired value to the PDR register before setting the DDR register for output.

- P76, P77 (MB90485 series only)

This port has no DDR. To use P77 and P76 as I²C pins, set the PDR value to “1” so that port data remains enabled (to use P77 and P76 for general purposes, disable I²C). The port is an open drain output (with no P-ch).

To use it as an input port, therefore, set the PDR to “1” to turn off the output transistor and add a pull-up resistor to the external output.

(3) Port Input Resistance Registers

RDR0	7	6	5	4	3	2	1	0	Initial value	Access
Address : 00001C _H	RD07	RD06	RD05	RD04	RD03	RD02	RD01	RD00	00000000 _B	R/W
RDR1	7	6	5	4	3	2	1	0	Initial value	Access
Address : 00001D _H	RD17	RD16	RD15	RD14	RD13	RD12	RD11	RD10	00000000 _B	R/W

These registers control the use of pull-up resistance in input mode.

- 0 : No pull-up resistance in input mode.
- 1 : With pull-up resistance in input mode.

In output mode, these registers have no function (no pull-up resistance) . Input/output mode settings are controlled by the setting of port direction (DDR) registers.

In case of a stop (SPL = 1) , no pull-up resistance is applied (high impedance) . Using of this function is prohibited when an external bus is used. Do not write to these registers.

(4) Port Output Pin Registers

ODR7	7	6	5	4	3	2	1	0	Initial value	Access
Address : 00001E _H	OD77*1	OD76*1	OD75	OD74	OD73	OD72	OD71	OD70	00000000 _B *2	R/W
ODR4	7	6	5	4	3	2	1	0	Initial value	Access
Address : 00001B _H	OD47	OD46	OD45	OD44	OD43	OD42	OD41	OD40	00000000 _B	R/W

*1 : The value is set to “—” on MB90485 series only.

*2 : The initial value of this bit is “XX000000_B” on MB90485 series only.

These registers control open drain settings in output mode.

- 0 : Standard output port functions in output mode.
- 1 : Open drain output port in output mode.

In input mode, these registers have no function (Hi-Z output) . Input/output mode settings are controlled by the setting of port direction (DDR) registers. Using of this function is prohibited when an external bus is used. Do not write to these registers.

(5) Analog Input Enable Register

ADER	7	6	5	4	3	2	1	0	Initial value	Access
Address : 00001F _H	ADE7	ADE6	ADE5	ADE4	ADE3	ADE2	ADE1	ADE0	11111111 _B	R/W

This register controls the port 6 pins as follows.

- 0 : Port input/output mode.
- 1 : Analog input mode. The default value at reset is all “1”.

(6) Up/down Timer Input Enable Register

UDER	7	6	5	4	3	2	1	0	Initial value	Access
Address : 00000B _H	—	—	UDE5	UDE4	UDE3	UDE2	UDE1	UDE0	XX000000 _B	R/W

This register controls the port 3 pins as follows.

- 0 : Port input mode.
- 1 : Up/down timer input mode. The default value at reset is “0”.

2. UART

The UART is a serial I/O port for asynchronous (start-stop synchronized) communication as well as CLK synchronized communication.

- Full duplex double buffer
- Transfer modes : asynchronous (start-stop synchronized) , or CLK synchronized (no start bit or stop bit) .
- Multi-processor mode supported.
- Embedded proprietary baud rate generator
 - Asynchronous : 76923/38461/19230/9615/500 k/250 kbps
 - CLK synchronized : 16 M/8 M/4 M/2 M/1 M/500 kbps
- External clock setting available, allows use of any desired baud rate.
- Can use internal clock feed from PPG1.
- Data length : 7-bit (asynchronous normal mode only) or 8-bit.
- Master/slave type communication functions (in multi-processor mode) .
- Error detection functions (parity, framing, overrun)
- Transfer signals are NRZ encoded.
- μ DMAC supported (for receiving/sending)

(2) Block Diagram

3. Expanded I/O Serial Interface

The expanded I/O serial interface is an 8-bit × 1-channel serial I/O interface for clock synchronized data transfer. A selection of LSB-first or MSB-first data transfer is provided.

There are two serial I/O operation modes.

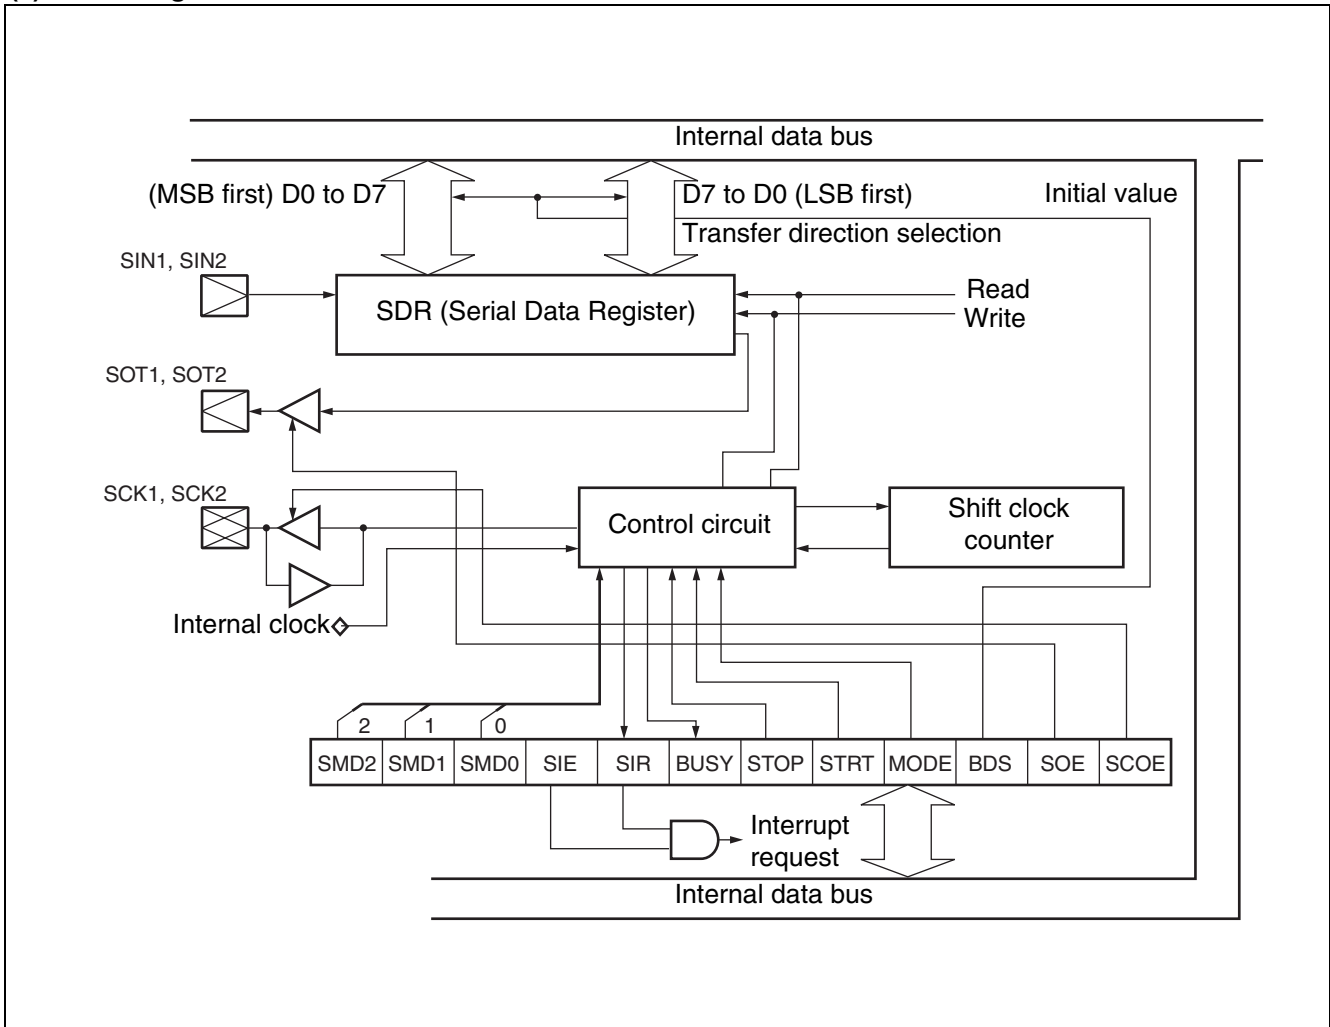

- Internal shift clock mode : Data transfer is synchronized with the internal clock signal.
- External shift clock mode : Data transfer is synchronized with a clock signal input from the external clock signal pin (SCK) . In this mode the general-purpose port that shares the external clock signal pin (SCK) can be used for transfer according to CPU instructions.

(1) Register List

(2) Block Diagram

4. 8/10-bit A/D Converter

The A/D converter converts analog input voltage to digital values, and provides the following features.

- Conversion time : minimum 3.68 μ s per channel
(92 machine cycles at 25 MHz machine clock, including sampling time)
- Sampling time : minimum 1.92 μ s per channel
(48 machine cycles at 25 MHz machine clock)
- RC sequential comparison conversion method, with sample & hold circuit.
- 8-bit or 10-bit resolution
- Analog input selection of 8 channels

Single conversion mode : Conversion from one selected channel.

Scan conversion mode : Conversion from multiple consecutive channels, programmable selection of up to 8 channels.

Continuous conversion mode : Repeated conversion of specified channels.

Stop conversion mode : Conversion from one channel followed by a pause until the next activation allows to synchronize with conversion start.

- At the end of A/D conversion, an A/D conversion completed interrupt request can be generated to the CPU. The interrupt can be used activate the μ DMAC in order to transfer the results of A/D conversion to memory for efficient continuous processing.
- The starting factor conversion may be selected from software, external trigger (falling edge) , or timer (rising edge) .

5. 8/16-bit PPG

The 8/16-bit PPG is an 8-bit reload timer module that produces a PPG output using a pulse from the timer operation. Hardware resources include 6 × 8-bit down counters, 12 × 8-bit reload timers, 3 × 16-bit control registers, 6 × external pulse output pins, and 6 × interrupt outputs. Note that MB90480/485 series has six channels for 8-bit PPG use, which can also be combined as PPG0 + PPG1, PPG2 + PPG3, and PPG4 + PPG5 to operate as a three-channel 16-bit PPG. The following is a summary of functions.

- 8-bit PPG output 6-channel independent mode : Provides PPG output operation on six independent channels.
- 16-bit PPG output operation mode : Provides 16-bit PPG output on three channels. The six original channels are used in combination as PPG0 + PPG1, PPG2 + PPG3, and PPG4 + PPG5.
- 8 + 8-bit PPG output operation mode : Output from PPG0 (PPG2/PPG4) is used as clock input to PPG1 (PPG3/PPG5) to provide to 8-bit PPG output at any desired period length.
- PPG output operation : Produces pulse waves at any desired period and duty ratio. The PPG module can also be used with external circuits as a D/A converter.

6. 8/16-bit up/down Counter/Timer

8/16-bit up/down counter/timer consists of up/down counter/timer circuits including six event input pins, two 8-bit up/down counters, two 8-bit reload/compare registers, as well as the related control circuits.

(1) Principal Functions

- 8-bit count register enables counting in the range 0 to 256.
(In 16-bit \times 1 mode, counting is enabled in the range 0 to 65535)
- Count clock selection provides four count modes.

- In timer mode, there is a choice of two internal count clock signals.

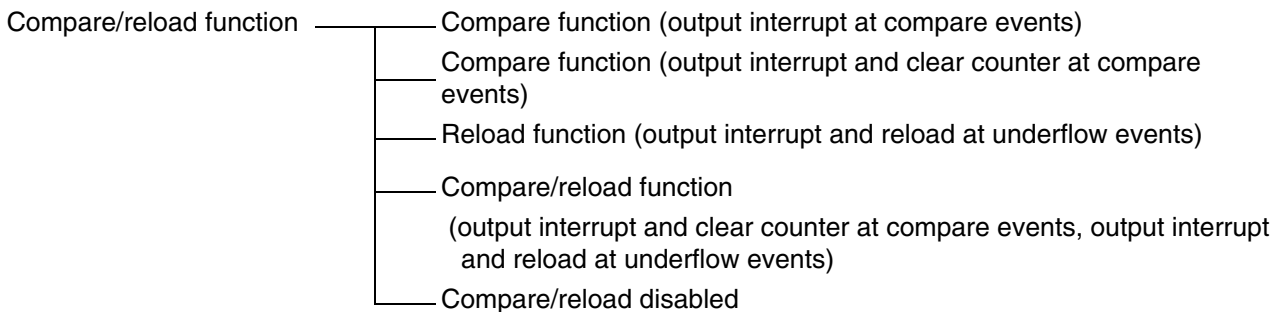

- In up/down count mode, there is a choice of trigger edge detection for the input signal from external pins.

- In phase differential count mode, to handle encoder counting for motors, the encoder A-phase, B-phase, and Z-phase are each input, enabling easy and highly accurate counting of angle of rotation, speed of rotation, etc.
- The ZIN pin provides a selection of two functions.

- A compare function and reload function are provided, each for use separately or in combination. Both functions can be activated together for up/down counting in any desired bandwidth.

- Individual control over interrupts at compare, reload (underflow) and overflow events.
- Count direction flag enables identification of the last previous count direction.
- Interrupt generated when count direction changes.

7. DTP/External Interrupt

The DTP (Data Transfer Peripheral) is a peripheral block that interfaces external peripherals to the F²MC-16LX CPU. The DTP receives DMA and interrupt processing requests from external peripherals and passes the requests to the F²MC-16LX CPU to activate the extended intelligent μ DMAC or interrupt processing.

(1) Detailed Register Descriptions

8. 16-bit Input/Output Timer

The 16-bit input/output timer module is composed of one 16-bit free run timer, six output compare and two input capture modules. These functions can be used to output six independent waveforms based on the 16-bit free run timer, enabling input pulse width measurement and external clock frequency measurement.

• Register List

(1) 16-bit Free Run Timer

The 16-bit free run timer is composed of a 16-bit up-down counter and control status register. The counter value of this timer is used as the base timer for the input capture and output compare.

- The counter operation provides a choice of eight clock types.
- A counter overflow interrupt can be produced.
- A mode setting is available to initialize the counter value whenever the output compare value matches the value in the compare clear register.

(2) Output Compare

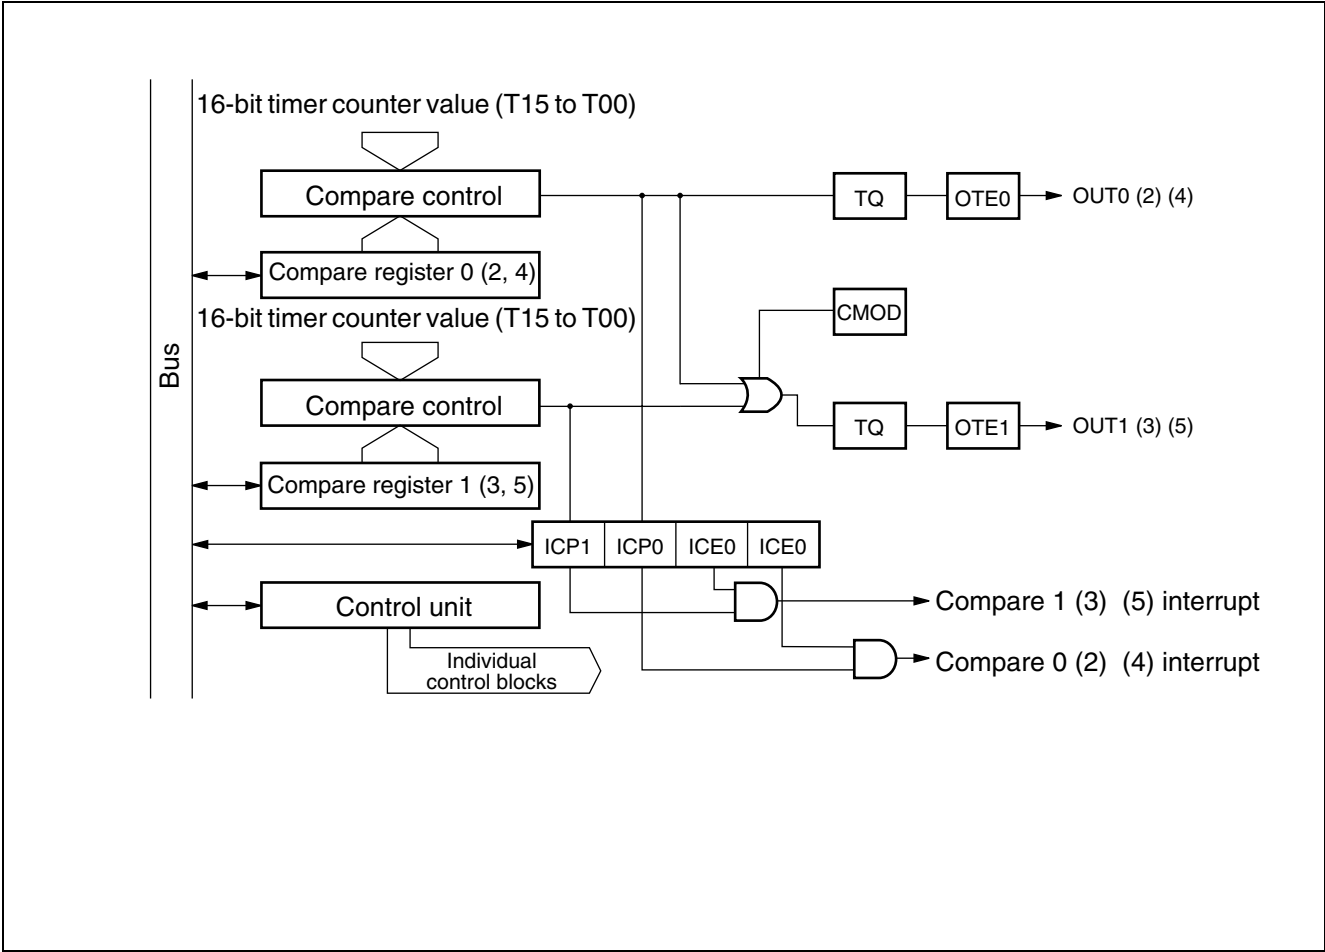

The output compare module is composed of a 16-bit compare register, compare output pin unit, and control register. When the value in the compare register in this module matches the 16-bit free run timer, the pin output levels can be inverted and an interrupt generated.

- There are six compare registers in all, each operating independently. A setting is available to allow two compare registers to be used to control output.
- Interrupts can be set in terms of compare match events.

- Register List

MB90480/485 Series

(3) Input Capture

The input capture module performs the functions of detecting the rising edge, falling edge, or both edges of signal input from external circuits, and saving the 16-bit free run timer value at that moment to a register. An interrupt can also be generated at the instant of edge detection.

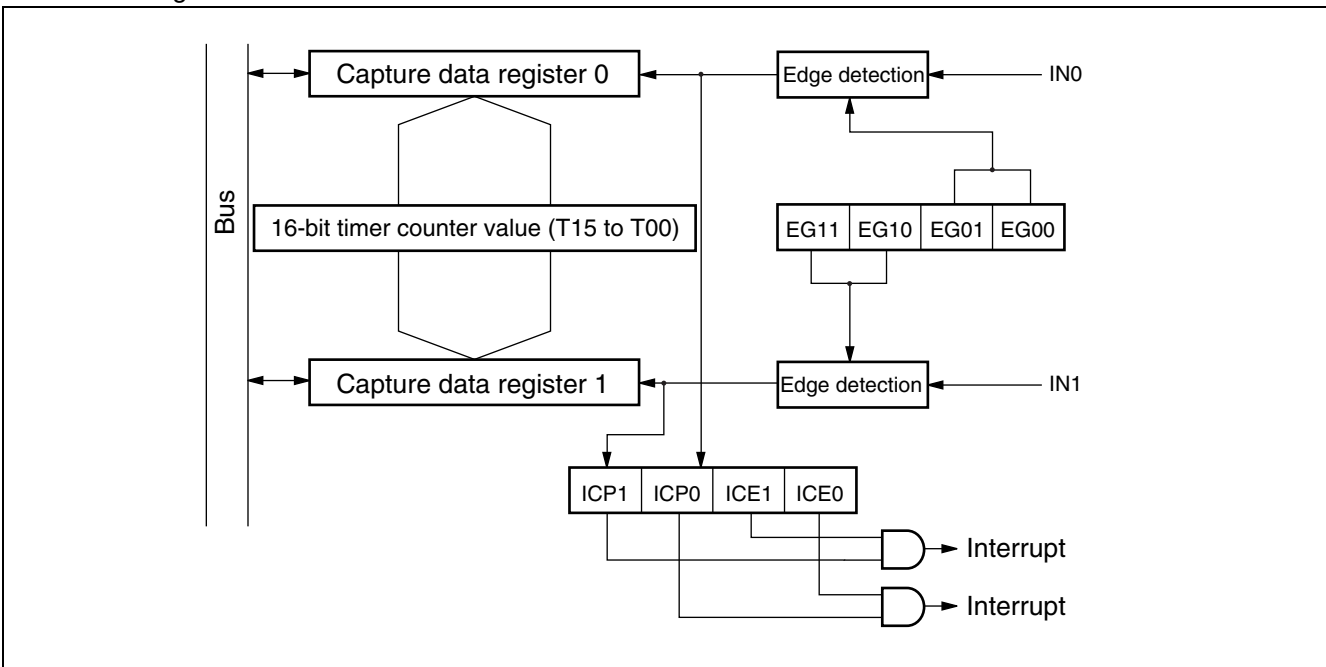

The input capture module consists of input capture registers and a control register. Each input capture module has its own external input pin.

- Selection of three types of valid edge for external input signals.
Rising edge, falling edge, both edges.
- An interrupt can be generated when a valid edge is detected in the external input signal.

• Register List

9. I²C Interface (MB90485 series only)

The I²C interface is a serial I/O port supporting the Inter IC BUS. Serves as a master/slave device on the I²C bus. The I²C interface has the following functions.

- Master/slave transmit/receive
- Arbitration function
- Clock synchronization
- Slave address/general call address detection function
- Forwarding direction detection function
- Start condition repeated generation and detection
- Bus error detection function

10. 16-bit Reload Timer

The 16-bit reload timer provides a choice of functions, including internal clock signals that count down in synchronization with three types of internal clock, as well as an event count mode that counts down at specified edge detection events in pulse signals input from external pins. This timer defines an underflow as a change in count value from 0000H to FFFFH. Thus an underflow will occur when counting from the value “reload register setting value + 1”. The choice of counting operations includes reload mode, in which the count setting values is reloaded and counting continues following an underflow event, and one-shot mode, in which an underflow event causes counting to stop. An interrupt can be generated at counter underflow, and the timer is DTC compatible.

12. PWC Timer (MB90485 series only)

The PWC timer is a 16-bit multifunction up-count timer capable of measuring the pulse width of the input signal. A total of three channels are provided, each consisting of a 16-bit up-count timer, an input pulse divider & divide ratio control register, a measurement input pin, and a 16-bit control register. These components provide the following functions.

Timer function : • Capable of generating an interrupt request at fixed intervals specified.
• The internal clock used as the reference clock can be selected from among three types.

Pulse width measurement function : • Measures the time between arbitrary events based on external pulse inputs.
• The internal clock used as the reference clock can be selected from among three types.
• Measurement modes
- “H” pulse width (\uparrow to \downarrow) / “L” pulse width (\uparrow to \downarrow)
- Rising cycle (\uparrow to \uparrow) / Falling cycle (\downarrow to \downarrow)
- Measurement between edges (\uparrow or \downarrow to \downarrow or \uparrow)
• The 8-bit input divider can be used for division measurement by dividing the input pulse by $2^2 \times n$ ($n = 1, 2, 3, 4$) .
• An interrupt can be generated upon completion of measurement.
• One-time measurement or fast measurement can be selected.

16. Clock

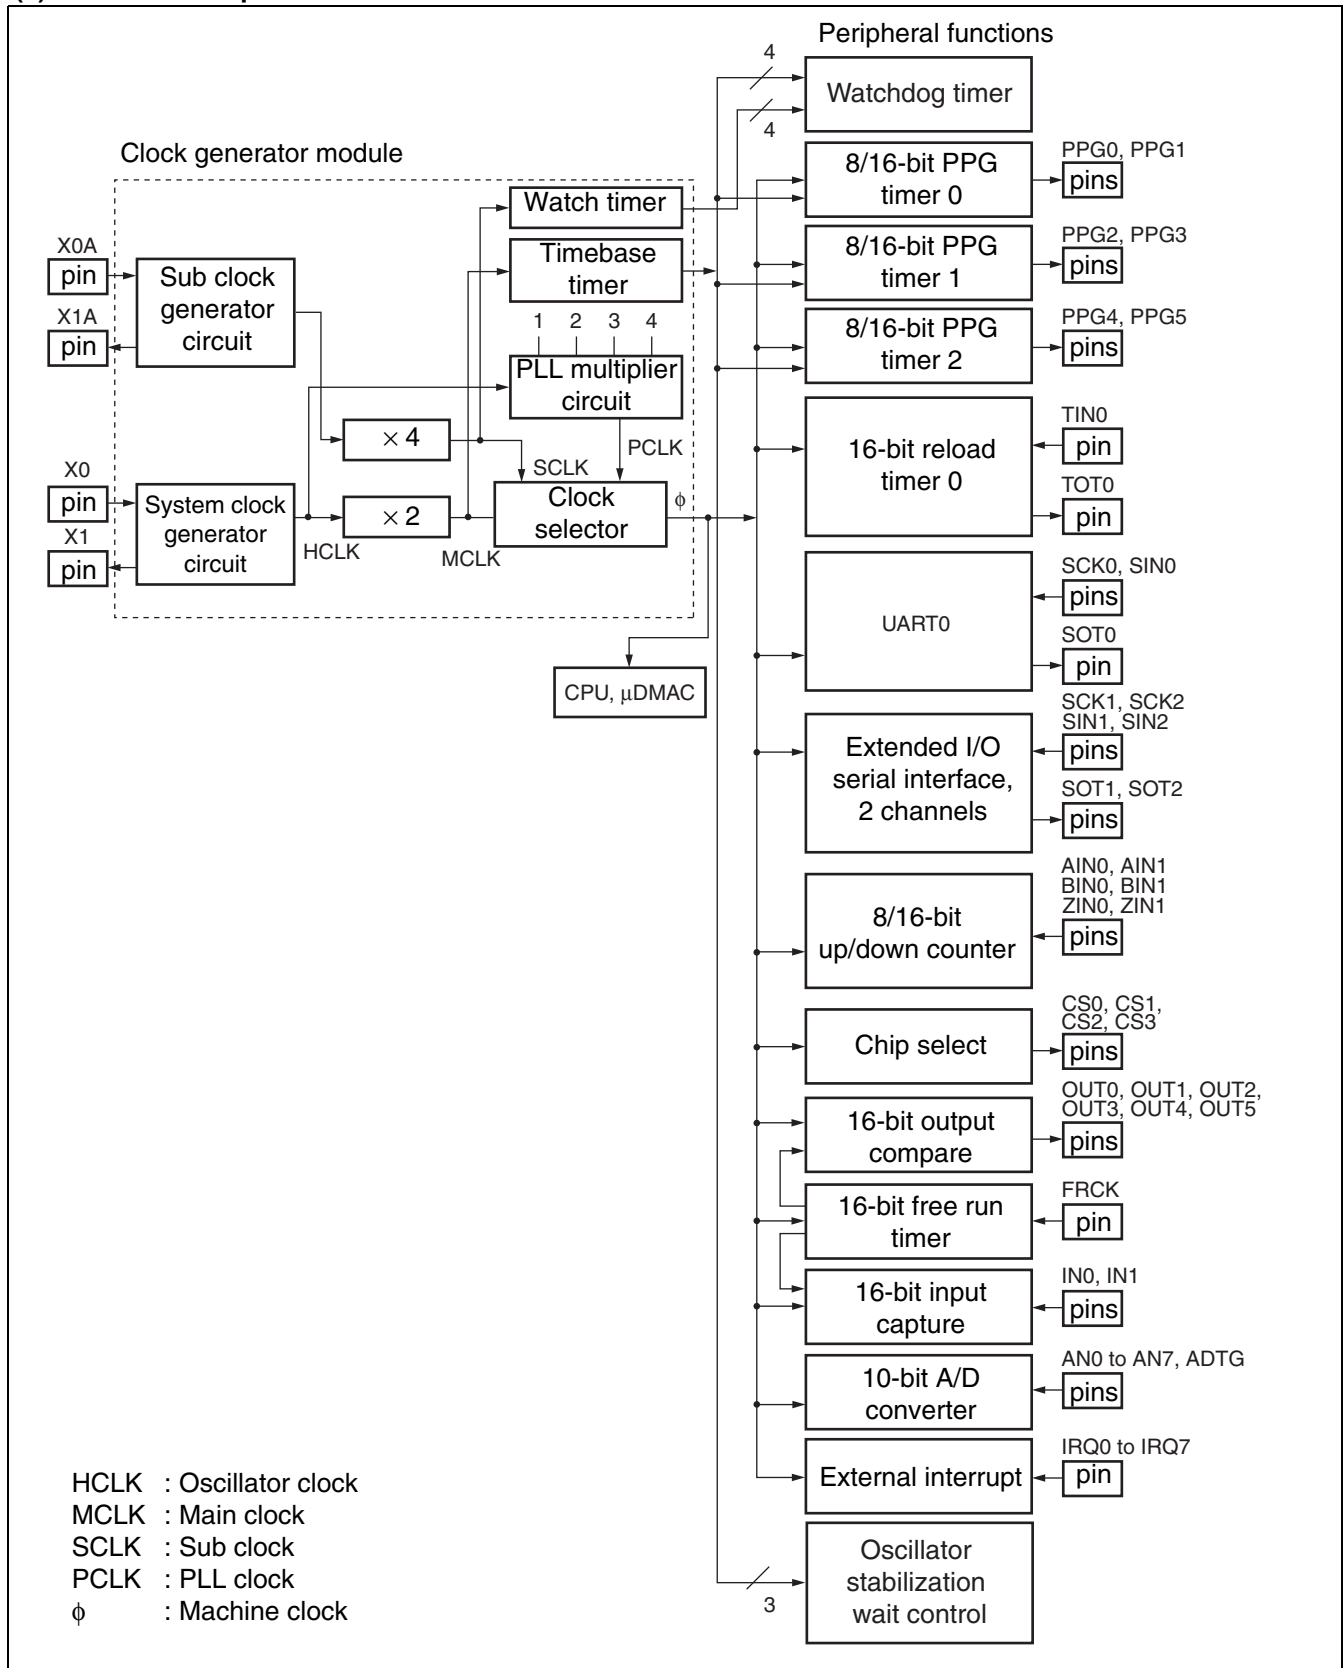

The clock generator module controls the operation of the internal clock circuits that serve as the operating clock for the CPU and peripheral devices. This internal clock is referred to as the machine clock, and one cycle is referred to as a machine cycle. Also, the clock signals from the base oscillator are called the oscillator clock, and those from the PLL oscillator are called the PLL clock.

(2) Block Diagram

19. Chip Select Function Description

The chip select module generates a chip select signals, which are used to facilitate connections to external memory devices. The MB90480/485 series has four chip select output pins, each having a chip select area register setting that specifies the corresponding hardware area and select signal that is output when access to the corresponding external address is detected.

- Chip select function features

The chip select function uses two 8-bit registers for each output pin. One of these registers (CARx) is able to detect memory areas in 64 Kbytes units by specifying the upper 8-bit of the address for match detection. The other register (CMRx) can be used to expand the detection area beyond 64 Kbytes by masking bits for match detection.

Note that during external bus holds, the CS output is set to high impedance.

22. μ DMAC

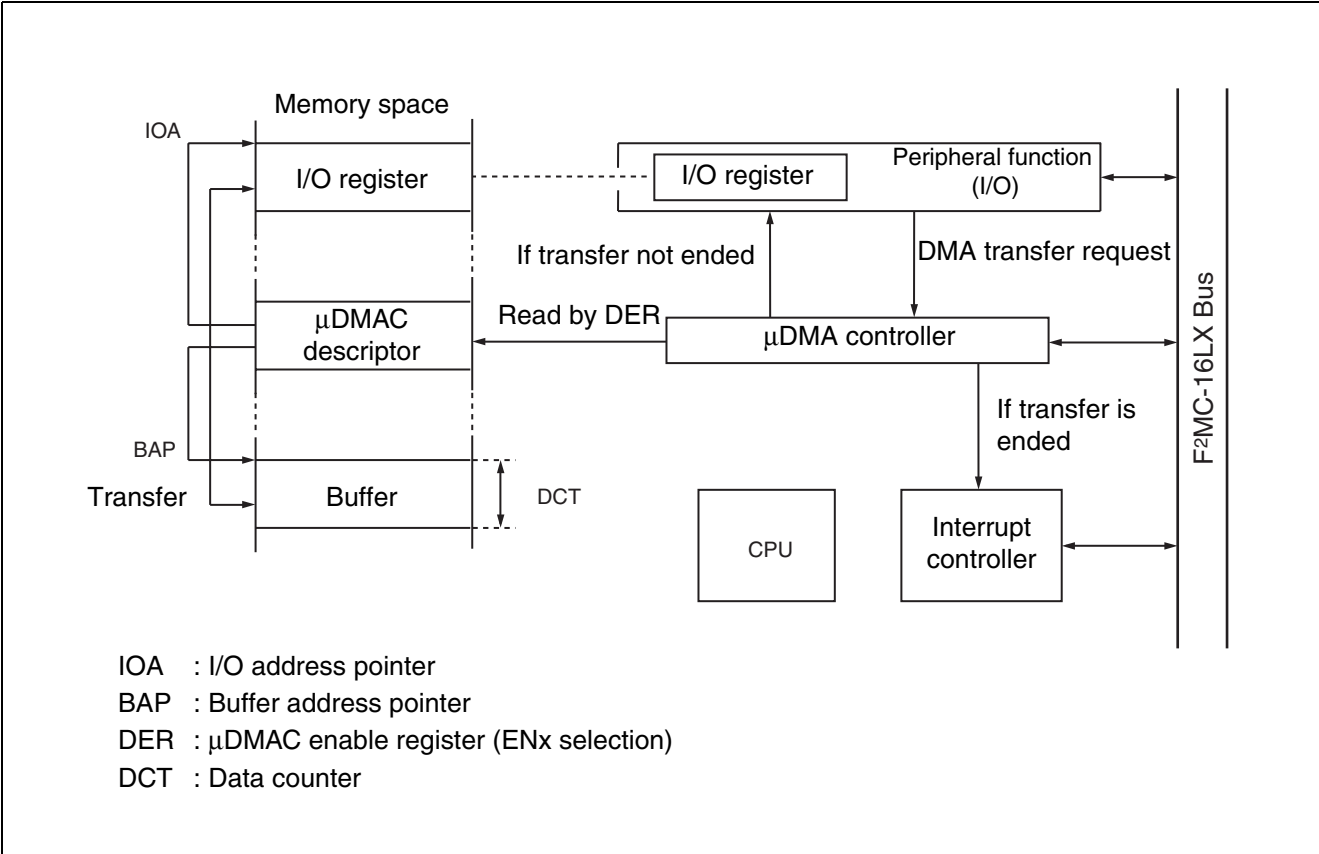

The μ DMAC is a simplified DMA module with functions equivalent to EI²OS. The μ DMAC has 16 DMA data transfer channels, and provides the following functions.

- Automatic data transfer between peripheral resources (I/O) and memory.
- CPU program execution stops during DMA operation.
- Incremental addressing for transfer source and destination can be turned on/off.
- DMA transfer control from the μ DMAC enable register, μ DMAC stop status register, μ DMAC status register, and descriptor.
- Stop requests from resources can stop DMA transfer.
- When DMA transfer is completed, the μ DMAC status register sets a flag in the bit for the corresponding channel on which transfer was completed, and outputs a completion interrupt to the interrupt controller.

23. Address Match Detection Function

When the address is equal to a value set in the address detection register, the instruction code loaded into the CPU is replaced forcibly with the INT9 instruction code (01H). As a result, when the CPU executes a set instruction, the INT9 instruction is executed. Processing by the INT#9 interrupt routine allows the program patching function to be implemented.

Two address detection registers are supported. An interrupt enable bit is prepared for each register. If the value set in the address detection register matches an address and if the interrupt enable bit is set at "1", the instruction code loaded into the CPU is replaced forcibly with the INT9 instruction code.

Operating temperature	T _A	-40	+85	°C	
Storage temperature	T _{stg}	-55	+150	°C	

*1 : This parameter is based on V_{SS} = AV_{SS} = 0.0 V.

*2 : AV_{CC} and AVR_H must not exceed V_{CC}. Also, AVR_H must not exceed AV_{CC}.

*3 : V_I and V_O must not exceed V_{CC} + 0.3 V. However, if the maximum current to/from and input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating.

*4 : Maximum output current is defined as the peak value for one of the corresponding pins.

*5 : Average output current is defined as the average current flow in a 100 ms interval at one of the corresponding pins.

*6 : Average total output current is defined as the average current flow in a 100 ms interval at all corresponding pins.

*7 : • Applicable to pins : P00 to P07, P10 to P17, P20 to P27, P30 to P37, P40 to P47, P50 to P57, P60 to P67, P70 to P77, P80 to P87, P90 to P97, PA0 to PA3

• Use within recommended operating conditions.

• Use at DC voltage (current) .

• The +B signal should always be applied with a limiting resistance placed between the +B signal and the microcontroller.

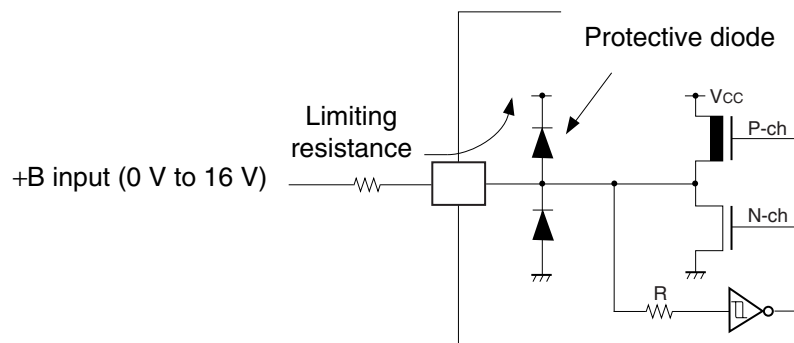

• The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.

(Continued)

(Continued)

- Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V_{CC} pin, and this may affect other devices.
- Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V), the power supply is provided from the pins, so that incomplete operation may result.
- Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the power-on reset.
- Care must be taken not to leave the +B input pin open.
- Note that analog system input/output pins other than the A/D input pins (LCD drive pins, comparator input pins, etc.) cannot accept +B signal input.
- Sample recommended circuits:

- Input/Output Equivalent circuits

*8 : MB90485 series only

P20 to P27, P30 to P37, P40 to P47, P70 to P77 pins can be used as 5 V I/F pin on applied 5 V to V_{CC5} pin.
P76 and P77 is N-ch open drain pin.

*9 : As for P76 and P77 (N-ch open drain pin), even if using at 3 V simplicity ($V_{CC3} = V_{CC5}$), the ratings are applied.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

MB90480/485 Series

2. Recommended Operating Conditions

($V_{SS} = AV_{SS} = 0.0\text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply voltage	V_{CC3}	2.7	3.6	V	During normal operation
		1.8	3.6	V	To maintain RAM state in stop mode
	V_{CC5}	2.7	5.5	V	During normal operation*
		1.8	5.5	V	To maintain RAM state in stop mode*
“H” level input voltage	V_{IH}	$0.7 V_{CC}$	$V_{CC} + 0.3$	V	All pins other than V_{IH2} , V_{IHS} , V_{IHM} and V_{IHx}
	V_{IH2}	$0.7 V_{CC}$	$V_{SS} + 5.8$	V	MB90485 series only P76, P77 pins (N-ch open drain pins)
	V_{IHS}	$0.8 V_{CC}$	$V_{CC} + 0.3$	V	Hysteresis input pins
	V_{IHM}	$V_{CC} - 0.3$	$V_{CC} + 0.3$	V	MD pin input
	V_{IHx}	$0.8 V_{CC}$	$V_{CC} + 0.3$	V	X0A pin, X1A pin
“L” level input voltage	V_{IL}	$V_{SS} - 0.3$	$0.3 V_{CC}$	V	All pins other than V_{ILS} , V_{ILM} and V_{ILx}
	V_{ILS}	$V_{SS} - 0.3$	$0.2 V_{CC}$	V	Hysteresis input pins
	V_{ILM}	$V_{SS} - 0.3$	$V_{SS} + 0.3$	V	MD pin input
	V_{ILx}	$V_{SS} - 0.3$	0.1	V	X0A pin, X1A pin
Operating temperature	T_A	-40	+85	°C	

* : MB90485 series only

P20 to P27, P30 to P37, P40 to P47, P70 to P77 pins can be used as 5 V I/F pin on applied 5 V to V_{CC5} pin.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

MB90480/485 Series

3. DC Characteristics

($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max		
“H” level output voltage	V_{OH}	All output pins	$V_{CC} = 2.7\text{ V}$, $I_{OH} = -1.6\text{ mA}$	$V_{CC3} - 0.3$	—	—	V	
			$V_{CC} = 4.5\text{ V}$, $I_{OH} = -4.0\text{ mA}$	$V_{CC5} - 0.5$	—	—	V	At using 5 V power supply
“L” level output voltage	V_{OL}	All output pins	$V_{CC} = 2.7\text{ V}$, $I_{OL} = 2.0\text{ mA}$	—	—	0.4	V	
			$V_{CC} = 4.5\text{ V}$, $I_{OH} = 4.0\text{ mA}$	—	—	0.4	V	At using 5 V power supply
Input leakage current	I_{IL}	All input pins	$V_{CC} = 3.3\text{ V}$, $V_{SS} < V_I < V_{CC}$	-10	—	+10	μA	
Pull-up resistance	R_{PULL}	—	$V_{CC} = 3.0\text{ V}$, at $T_A = +25\text{ }^\circ\text{C}$	20	53	200	$\text{k}\Omega$	
Open drain output current	I_{leak}	P40 to P47, P70 to P77	—	—	0.1	10	μA	
Power supply current	I_{CC}	—	At $V_{CC} = 3.3\text{ V}$, internal 25 MHz operation, normal operation	—	45	60	mA	
			At $V_{CC} = 3.3\text{ V}$, internal 25 MHz operation, Flash programming	—	55	70	mA	
	I_{CCS}	—	At $V_{CC} = 3.3\text{ V}$, internal 25 MHz operation, sleep mode	—	17	35	mA	
	I_{CCL}	—	At $V_{CC} = 3.3\text{ V}$, external 32 kHz, internal 8 kHz operation, sub clock operation ($T_A = +25\text{ }^\circ\text{C}$)	—	15	140	μA	
	I_{CCT}	—	At $V_{CC} = 3.3\text{ V}$, external 32 kHz, internal 8 kHz operation, watch mode ($T_A = +25\text{ }^\circ\text{C}$)	—	1.8	40	μA	
	I_{CCH}	—	$T_A = +25\text{ }^\circ\text{C}$, stop mode, At $V_{CC} = 3.3\text{ V}$	—	0.8	40	μA	
Input capacitance	C_{IN}	Other than AV_{CC} , AV_{SS} , V_{CC} , V_{SS}	—	—	5	15	pF	

Notes :• MB90485 series only

- P40 to P47 and P70 to P77 are N-ch open drain pins with control, which are usually used as CMOS.
- P76 and P77 are open drain pins without P-ch.
- For use as a single 3 V power supply products, set $V_{CC} = V_{CC3} = V_{CC5}$.
- When the device is used with dual power supplies, P20 to P27, P30 to P37, P40 to P47 and P70 to P77 serve as 5 V pins while the other pins serve as 3 V I/O pins.

MB90480/485 Series

4. AC Characteristics

(1) Clock Timing

(V_{SS} = 0.0 V, T_A = -40 °C to +85 °C)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max		
Clock frequency	F _{CH}	X0, X1	—	3	—	25	MHz	External crystal oscillator
			—	3	—	50		External clock input
			—	4	—	25		1 multiplied PLL
			—	3	—	12.5		2 multiplied PLL
			—	3	—	6.66		3 multiplied PLL
			—	3	—	6.25		4 multiplied PLL
			—	3	—	4.16		6 multiplied PLL
			—	3	—	3.12		8 multiplied PLL
	F _{CL}	X0A, X1A	—	—	32.768	—	kHz	
Clock cycle time	t _c	X0, X1	—	20	—	333	ns	*1
	t _{CL}	X0A, X1A	—	—	30.5	—	μs	
Input clock pulse width	P _{WH} P _{WL}	X0	—	5	—	—	ns	
	P _{WLH} P _{WLL}	X0A	—	—	15.2	—	μs	*2
Input clock rise, fall time	t _{cr} t _{cf}	X0	—	—	—	5	ns	With external clock
Internal operating clock frequency	f _{CP}	—	—	1.5	—	25	MHz	*1
	f _{CPL}	—	—	—	8.192	—	kHz	
Internal operating clock cycle time	t _{CP}	—	—	40.0	—	666	ns	*1
	t _{CPL}	—	—	—	122.1	—	μs	

*1 : Be careful of the operating voltage.

*2 : Duty ratio should be 50 % ± 3 %.

- X0, X1 clock timing

- X0A, X1A clock timing

MB90480/485 Series

- Range of warranted PLL operation

- Notes:
- For A/D operating frequency, refer to “5. A/D Converter Electrical Characteristics”
 - Only at 1 multiplied PLL, use with more than $f_{CP} = 4$ MHz.

*1 : In setting as 1, 2, 3 and 4 multiplied PLL, when the internal clock is used at $20 \text{ MHz} < f_{CP} \leq 25 \text{ MHz}$, set the PLLOS register to “DIV2 bit = 1” and “PLL2 bit = 1”.

[Example] When using the base oscillator frequency of 24 MHz at 1 multiplied PLL :
 CKSCR register : CS1 bit = “0”, CS0 bit = “0” PLLOS register : PLL2 bit = “1”

[Example] When using the base oscillator frequency of 6 MHz at 3 multiplied PLL :
 CKSCR register : CS1 bit = “1”, CS0 bit = “0” PLLOS register : PLL2 bit = “1”

*2 : In setting as 2 and 4 multiplied PLL, when the internal clock is used at $20 \text{ MHz} < f_{CP} \leq 25 \text{ MHz}$, the following setting is also enabled.

2 multiplied PLL : CKSCR register : CS1 bit = “0”, CS0 bit = “0”
 PLLOS register : PLL2 bit = “1”

4 multiplied PLL : CKSCR register : CS1 bit = “0”, CS0 bit = “1”
 PLLOS register : PLL2 bit = “1”

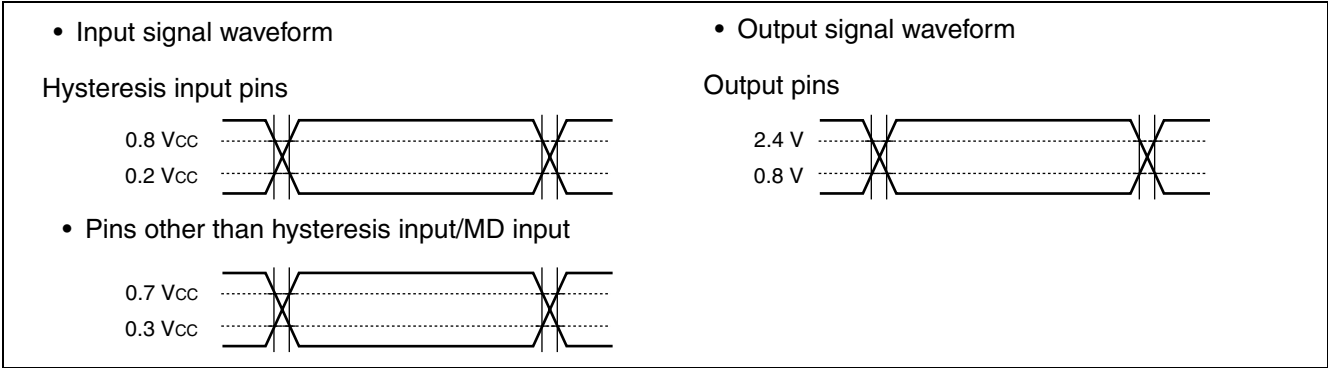

*3 : When using in setting as 6 and 8 multiplied PLL, set the PLLOS register to “DIV2 bit = 0” and “PLL2 bit = 1”.

[Example] When using the base oscillator frequency of 4 MHz at 6 multiplied PLL :
 CKSCR register : CS1 bit = “1”, CS0 bit = “0” PLLOS register : PLL2 bit = “1”

[Example] When using the base oscillator frequency of 3 MHz at 8 multiplied PLL :
 CKSCR register : CS1 bit = “1”, CS0 bit = “1” PLLOS register : PLL2 bit = “1”

MB90480/485 Series

AC standards are set at the following measurement voltage values.

MB90480/485 Series

(2) Clock Output Timing

($V_{SS} = 0.0 \text{ V}$, $T_A = -40 \text{ }^\circ\text{C}$ to $+85 \text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Cycle time	t_{CYC}	CLK	—	t_{CP}^*	—	ns	
CLK \uparrow →CLK \downarrow	t_{CHCL}	CLK	$V_{CC} = 3.0 \text{ V to } 3.6 \text{ V}$	$t_{CP}^* / 2 - 15$	$t_{CP}^* / 2 + 15$	ns	at $f_{CP} = 25 \text{ MHz}$
			$V_{CC} = 2.7 \text{ V to } 3.3 \text{ V}$	$t_{CP}^* / 2 - 20$	$t_{CP}^* / 2 + 20$	ns	at $f_{CP} = 16 \text{ MHz}$
			$V_{CC} = 2.7 \text{ V to } 3.3 \text{ V}$	$t_{CP}^* / 2 - 64$	$t_{CP}^* / 2 + 64$	ns	at $f_{CP} = 5 \text{ MHz}$

* : t_{CP} is internal operating clock cycle time. Refer to “(1) Clock Timing”.

MB90480/485 Series

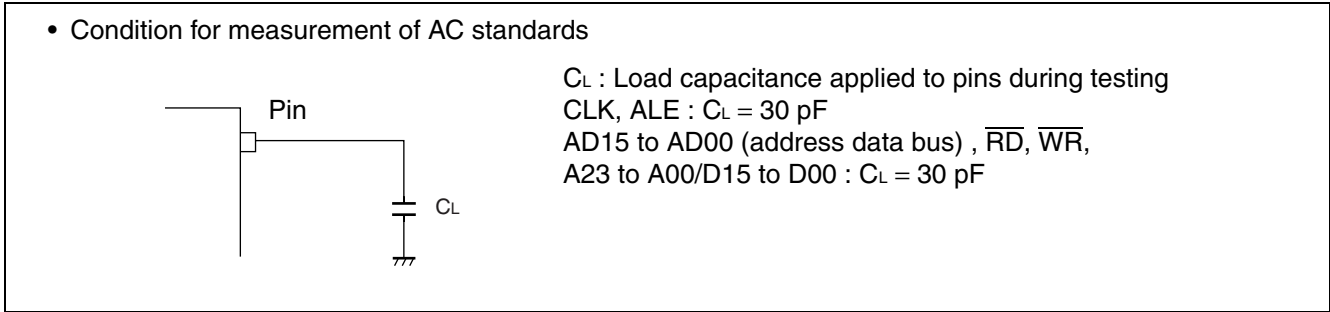

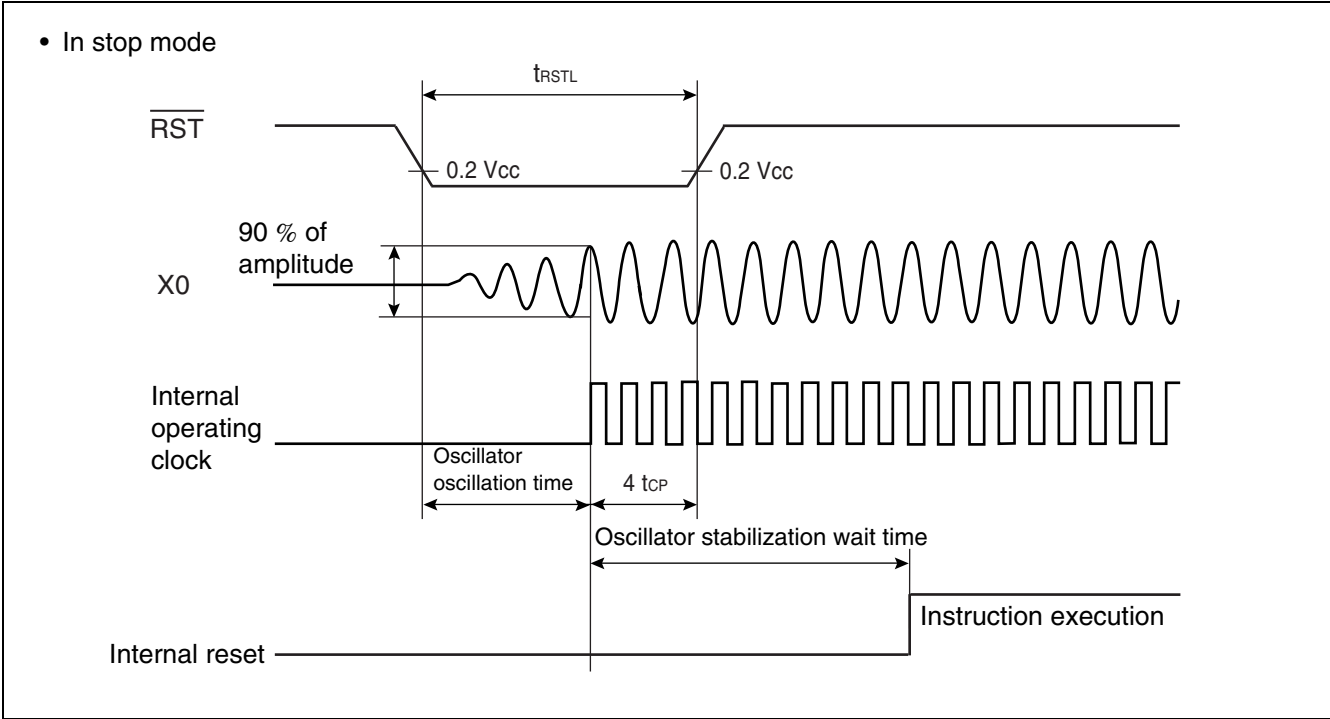

(3) Reset Input Standards

(V_{CC} = 2.7 V to 3.6 V, V_{SS} = 0.0 V, T_A = -40 °C to +85 °C)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Reset input time	t _{RSTL}	$\overline{\text{RST}}$	—	16 t _{CP} *1	—	ns	Normal operation
				Oscillator oscillation time*2 + 4 t _{CP} *1	—	ms	Stop mode

*1 : t_{CP} is internal operating clock cycle time. Refer to “ (1) Clock Timing”.

*2 : Oscillator oscillation time is the time to 90 % of amplitude. For a crystal oscillator this is on the order of several milliseconds to tens of milliseconds. For a ceramic oscillator, this is several hundred microseconds to several milliseconds. For an external clock signal the value is 0 ms.

MB90480/485 Series

(4) Power-on Reset Standards

($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Power rise time	t_R	V_{CC}	—	0.05	30	ms	*
Power down time	t_{OFF}	V_{CC}	—	1	—	ms	In repeated operation

* : Power rise time requires $V_{CC} < 0.2\text{ V}$.

Notes: • The above standards are for the application of a power-on reset.

- Within the device, the power-on reset should be applied by switching the power supply off and on again.

Note : Rapid fluctuations in power supply voltage may trigger a power-on reset in some cases. As shown below, when changing supply voltage during operation, it is recommended that voltage changes be suppressed and a smooth restart be applied.

MB90480/485 Series

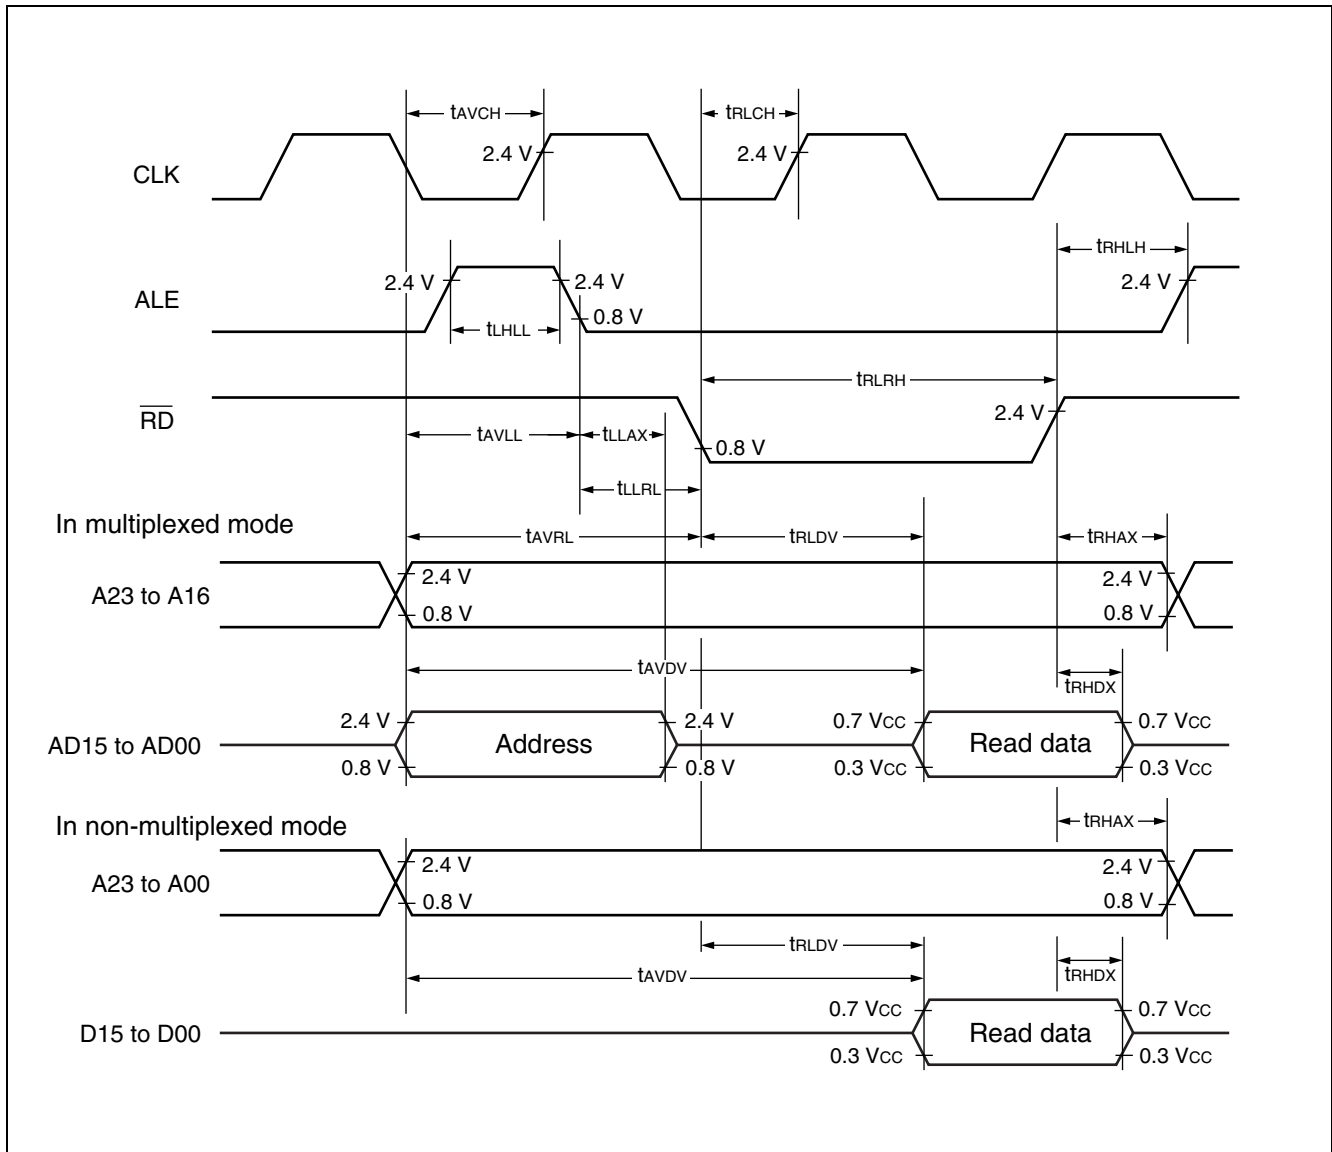

(5) Bus Read Timing

($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = 0\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$)

*1 : C_L is the load capacitance applied to pins for testing.

*2 : t_{CP} is internal operating clock cycle time. Refer to "(1) Clock Timing".

Notes : • The above rating is in CLK synchronous mode.
• Values on this table are target values.

- Internal shift clock mode

- External shift clock mode

MB90480/485 Series

(11) Timer Input Timing

($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Input pulse width	t_{TIWH} t_{TIWL}	TIN0, INO, IN1, PWC0 to PWC2	—	$4 t_{CP}^*$	—	ns	

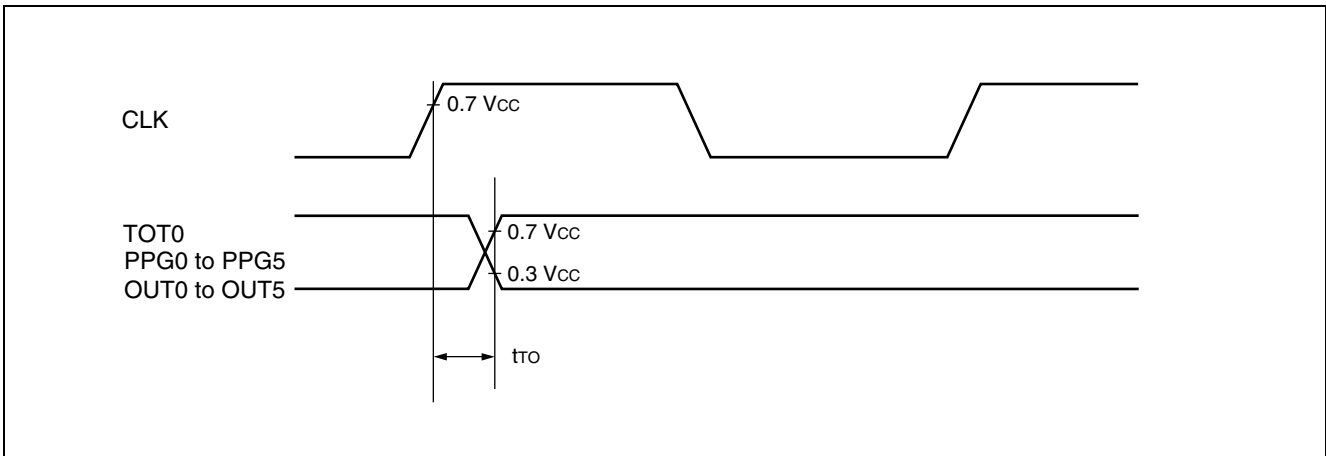

* : t_{CP} is internal operating clock cycle time. Refer to “(1) Clock Timing”.

(12) Timer Output Timing

($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
CLK \uparrow →Change time PPG0 to PPG5 change time OUT0 to OUT5 change time	t_{TO}	TOT0, PPG0 to PPG5, OUT0 to OUT5	Load conditions 80 pF	30	—	ns	

(13) I²C Timing

(V_{CC} = 2.7 V to 3.6 V, V_{SS} = 0.0 V, T_A = -40 °C to +85 °C)

Parameter	Symbol	Condition	Standard-mode		Unit
			Min	Max	
SCL clock frequency	f _{SCL}		0	100	kHz
Hold time (repeated) START condition SDA↓→SCL↓	t _{HDSTA}	When power supply voltage of external pull-up resistance is 5.5 V R = 1.3 kΩ, C = 50 pF*2	4.0	—	μs
“L” width of the SCL clock	t _{LOW}		4.7	—	μs
“H” width of the SCL clock	t _{HIGH}		4.0	—	μs
Set-up time (repeated) START condition SCL↑→SDA↓	t _{SUSTA}	When power supply voltage of external pull-up resistance is 3.6 V R = 1.6 kΩ, C = 50 pF*2	4.7	—	μs
Data hold time SCL↓→SDA↓↑	t _{HDDAT}		0	3.45*3	μs
Data set-up time SDA↓↑→SCL↑	t _{SUDAT}	When power supply voltage of external pull-up resistance is 5.5 V f _{CP} *1 ≤ 20 MHz, R = 1.3 kΩ, C = 50 pF*2 When power supply voltage of external pull-up resistance is 3.6 V f _{CP} *1 ≤ 20 MHz, R = 1.6 kΩ, C = 50 pF*2	250*4	—	ns
		When power supply voltage of external pull-up resistance is 5.5 V f _{CP} *1 > 20 MHz, R = 1.3 kΩ, C = 50 pF*2 When power supply voltage of external pull-up resistance is 3.6 V f _{CP} *1 > 20 MHz, R = 1.6 kΩ, C = 50 pF*2	200*4	—	ns
Set-up time for STOP condition SCL↑→SDA↑	t _{SUSTO}	When power supply voltage of external pull-up resistance is 5.5 V R = 1.3 kΩ, C = 50 pF*2	4.0	—	μs
Bus free time between a STOP and START condition	t _{BUS}	When power supply voltage of external pull-up resistance is 3.6 V R = 1.6 kΩ, C = 50 pF*2	4.7	—	μs

*1 : f_{CP} is internal operation clock frequency. Refer to “(1) Clock Timing”.

*2 : R,C : Pull-up resistor and load capacitor of the SCL and SDA lines.

*3 : The maximum t_{HDDAT} only has to be met if the device does not stretch the “L” width (t_{LOW}) of the SCL signal.

*4 : Refer to “• Note of SDA and SCL set-up time”.

Note : V_{CC} = V_{CC3} = V_{CC5}

MB90480/485 Series

- Note of SDA and SCL set-up time

Note : The rating of the input data set-up time in the device connected to the bus cannot be satisfied depending on the load capacitance or pull-up resistor.
Be sure to adjust the pull-up resistor of SDA and SCL if the rating of the input data set-up time cannot be satisfied.

- Timing definition

(14) Trigger Input Timing

($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Input pulse width	t_{TRGH}	ADTG, IRQ0 to IRQ7	—	$5 t_{CP}^*$	—	ns	Normal operation
	t_{TRGL}			1	—	μs	Stop mode

* : t_{CP} is internal operating clock cycle time. Refer to “(1) Clock Timing”.

(15) Up-down Counter Timing

($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
AIN input “H” pulse width	t_{AHL}	AIN0, AIN1, BIN0, BIN1	Load conditions 80 pF	$8 t_{CP}^*$	—	ns	
AIN input “L” pulse width	t_{ALL}			$8 t_{CP}^*$	—	ns	
BIN input “H” pulse width	t_{BHL}			$8 t_{CP}^*$	—	ns	
BIN input “L” pulse width	t_{BLL}			$8 t_{CP}^*$	—	ns	
AIN \uparrow →BIN \uparrow time	t_{AUBU}			$4 t_{CP}^*$	—	ns	
BIN \uparrow →AIN \downarrow time	t_{BUAD}			$4 t_{CP}^*$	—	ns	
AIN \downarrow →BIN \uparrow time	t_{ADBD}			$4 t_{CP}^*$	—	ns	
BIN \downarrow →AIN \uparrow time	t_{BDAU}			$4 t_{CP}^*$	—	ns	
BIN \uparrow →AIN \uparrow time	t_{BUAU}			$4 t_{CP}^*$	—	ns	
AIN \uparrow →BIN \downarrow time	t_{AUBD}			$4 t_{CP}^*$	—	ns	
BIN \downarrow →AIN \uparrow time	t_{BDAD}			$4 t_{CP}^*$	—	ns	
AIN \downarrow →BIN \uparrow time	t_{ADBU}			$4 t_{CP}^*$	—	ns	
ZIN input “H” pulse width	t_{ZHL}	ZIN0, ZIN1		$4 t_{CP}^*$	—	ns	
ZIN input “L” pulse width	t_{ZLL}			$4 t_{CP}^*$	—	ns	

* : t_{CP} is internal operating clock cycle time. Refer to “(1) Clock Timing”.

MB90480/485 Series

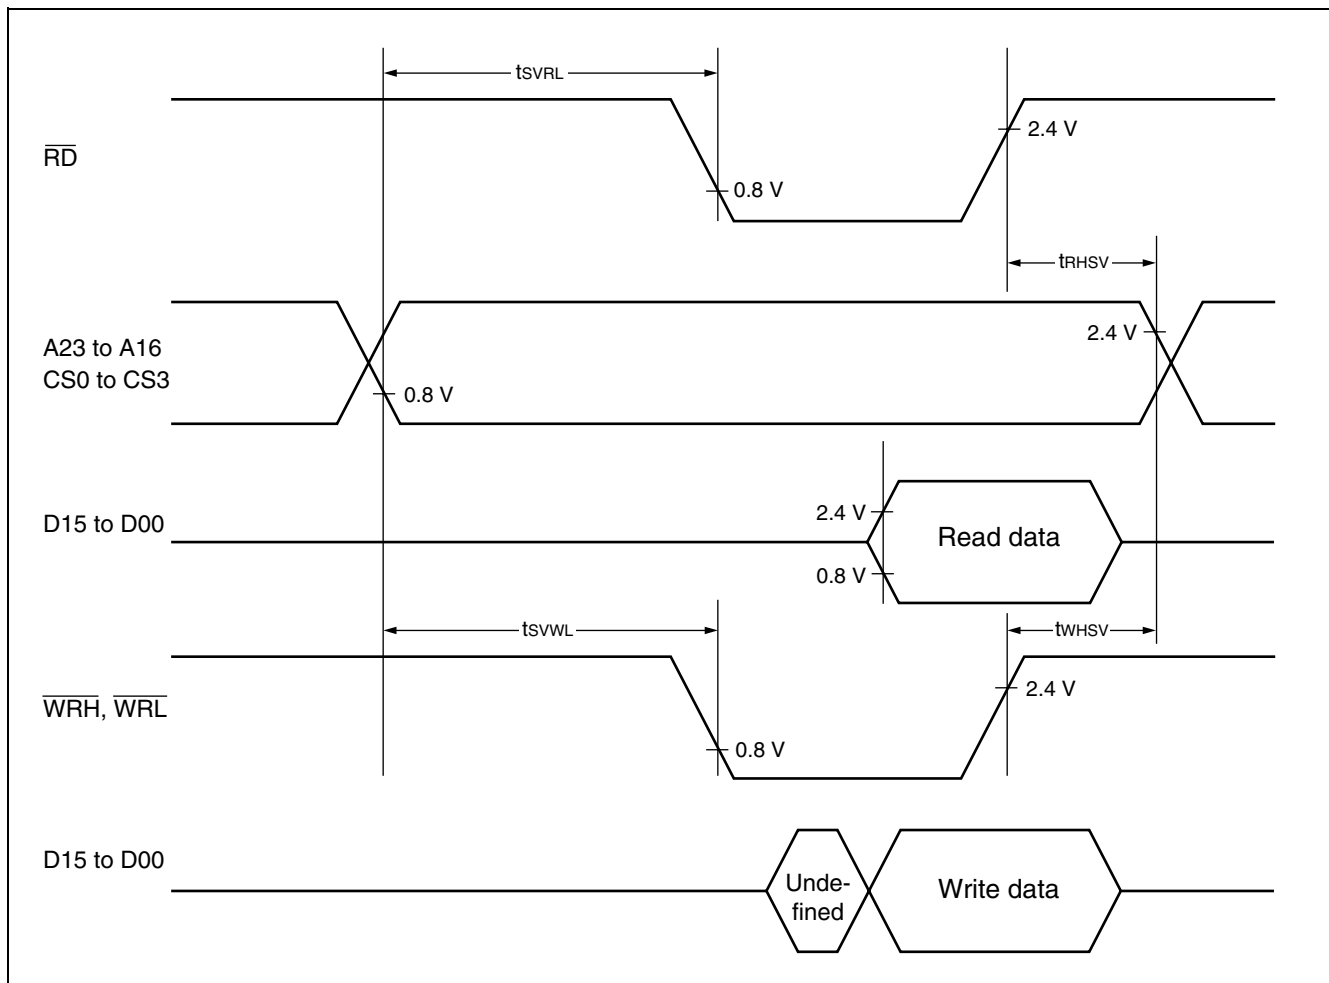

(16) Chip Select Output Timing

($V_{CC} = 2.7\text{ V to }3.6\text{ V}$, $V_{SS} = 0.0\text{ V}$, $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Chip select output valid time $\rightarrow \overline{RD}\downarrow$	t_{SVRL}	CS0 to CS3, \overline{RD}	—	$t_{CP}^* / 2 - 7$	—	ns	
Chip select output valid time $\rightarrow \overline{WR}\downarrow$	t_{SVWL}	CS0 to CS3, \overline{WRH} , \overline{WRL}	—	$t_{CP}^* / 2 - 7$	—	ns	
$\overline{RD}\uparrow \rightarrow$ chip select output valid time	t_{RHVS}	\overline{RD} , CS0 to CS3	—	$t_{CP}^* / 2 - 17$	—	ns	
$\overline{WR}\uparrow \rightarrow$ chip select output valid time	t_{WHVS}	\overline{WRH} , \overline{WRL} , CS0 to CS3	—	$t_{CP}^* / 2 - 17$	—	ns	

* : t_{CP} is internal operating clock cycle time. Refer to “(1) Clock Timing”.

Note : Due to the configuration of the internal bus, the chip select output signals are changed simultaneously and therefore may cause the bus conflict conditions. AC cannot be warranted between the ALE output signal and the chip select output signal.

MB90480/485 Series

5. A/D Converter Electrical Characteristics

($V_{CC} = AV_{CC} = 2.7\text{ V}$ to 3.6 V , $V_{SS} = AV_{SS} = 0.0\text{ V}$, $2.7\text{ V} \leq AVRH$, $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$)

Parameter	Symbol	Pin name	Value			Unit	Remarks
			Min	Typ	Max		
Resolution	—	—	—	—	10	bit	
Total error	—	—	—	—	± 3.0	LSB	
Linear error	—	—	—	—	± 2.5	LSB	
Differential linearity error	—	—	—	—	± 1.9	LSB	
Zero transition voltage	V_{OT}	AN0 to AN7	$AV_{SS} - 1.5\text{ LSB}$	$AV_{SS} + 0.5\text{ LSB}$	$AV_{SS} + 2.5\text{ LSB}$	mV	
Full scale transition voltage	V_{FST}	AN0 to AN7	$AVRH - 3.5\text{ LSB}$	$AVRH - 1.5\text{ LSB}$	$AVRH + 0.5\text{ LSB}$	mV	
Conversion time	—	—	3.68 *1	—	—	μs	
Analog port input current	I_{AIN}	AN0 to AN7	—	0.1	10	μA	
Analog input voltage	V_{AIN}	AN0 to AN7	AV_{SS}	—	$AVRH$	V	
Reference voltage	—	$AVRH$	$AV_{SS} + 2.2$	—	AV_{CC}	V	
Power supply current	I_A	AV_{CC}	—	1.4	3.5	mA	
	I_{AH}	AV_{CC}	—	—	5 *2	μA	
Reference voltage supply current	I_R	$AVRH$	—	94	150	μA	
	I_{RH}	$AVRH$	—	—	5 *2	μA	
Offset between channels	—	AN0 to AN7	—	—	4	LSB	

*1 : At machine clock frequency of 25 MHz.

*2 : CPU stop mode current when A/D converter is not operating (at $V_{CC} = AV_{CC} = AVRH = 3.0\text{ V}$).

- **About the external impedance of the analog input and its sampling time**

- A/D converter with sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion precision.

- Analog input equivalent circuit

	R	C
MB90487B	2.5 kΩ (Max)	31.0 pF (Max)
MB90F481/F482	1.9 kΩ (Max)	25.0 pF (Max)
MB90F488B/F489B	1.9 kΩ (Max)	25.0 pF (Max)

Note: The values are reference values.

- To satisfy the A/D conversion precision standard, consider the relationship between the external impedance and minimum sampling time and either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value.

- The relationship between external impedance and minimum sampling time

- If the sampling time cannot be sufficient, connect a capacitor of about 0.1 μF to the analog input pin.

- **About errors**

As $IAVRH - AV_{SSL}$ becomes smaller, values of relative errors grow larger.

Note : Concerning sampling time, and compare time when $3.6 V \geq AV_{CC} \geq 2.7 V$, then

Sampling time : 1.92 μs, compare time : 1.1 μs

Settings should ensure that actual values do not go below these values due to operating frequency changes.

MB90480/485 Series

•Flash Memory Program/Erase Characteristics

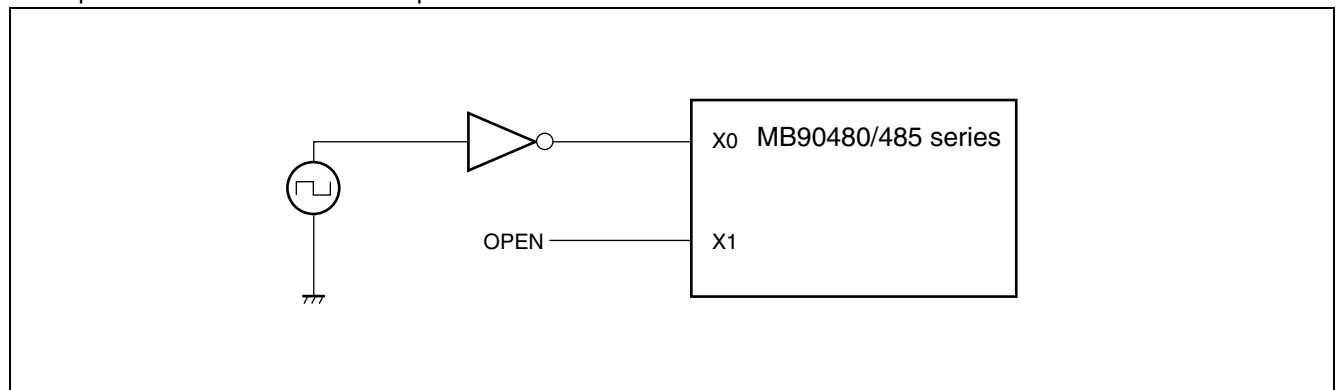

Parameter	Conditions	Value			Unit	Remarks
		Min	Typ	Max		
Sector erase time		—	1	15	s	Excludes 00H programming prior erasure
Chip erase time	$T_A = +25\text{ }^\circ\text{C}$, $V_{CC} = 3.0\text{ V}$	—	7	—	s	Excludes 00H programming prior erasure
Word (16-bit) programming time		—	16	3600	μs	Excludes system-level overhead
Program/Erase cycle	—	10000	—	—	cycle	
Flash Memory Data hold time	Average $T_A = +85\text{ }^\circ\text{C}$	10	—	—	year	*

* : The value comes from the technology qualification (using Arrhenius equation to translate high temperature measurements into normalized value at +85 °C) .

•Use of the X0/X1, X0A/X1A pins

•Sample use with external clock input

FUJITSU LIMITED

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of Fujitsu semiconductor device; Fujitsu does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information. Fujitsu assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of Fujitsu or any third party or does Fujitsu warrant non-infringement of any third-party's intellectual property right or other right by using such information. Fujitsu assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
