MIL-HDBK-217F Notice2 @Ta=25 °C, Full load(Ground, Benign, controlled environment).
  2. External with  $C_{out} = 1\mu F$  ceramic//10 $\mu F$  tantalum capacitors.
  3. External with  $C_{out} = 2 \times 150\mu F$  polymer capacitors.
  4. Output voltage programmable from 0.8V to 5.0V by connecting a single resistor (shown as Rtrim in Table 1) between the TRIM and GND pins of the module. To calculate the value of the resistor **Rtrim** for a particular output voltage **Vo**, use the following equation:
- $$R_{trim} = \left[ \frac{1200}{V_o - 0.80} - 100 \right] \Omega$$
5. To make sure the module is stable, input external capacitors is necessary that minimize input ripple voltage of the module.
  6. To minimize input reflected ripple. External  $\pi$  filter is recommended at the input of the module.  
The filter is shown as figure2.
  7. Delay from Vin,min to application of voltage on SEQ pin.
  8. Selecting current share function that the regulations may not meet listed specification.
  9. The On/Off signal is referenced to ground. The standard remote On/Off logic of the device is negative logic.  
Adding a device code suffix "-P" is option for positive logic of remote On/Off.
  10. Case 1 :On/Off input is set to logic low (module on) and then input power is applied (delay from instant at which Vin=Vin(min) until Vo=10% of Vo(set))
  11. Case 2 :Input power is applied for at least one second and then the On/Off input is set to logic low (delay form instant at which Von/off=0.3V until Vo=10% of Vo(set))

**CAUTION:** This power module is not internally fused. An input line fuse must always be used.
