

## 32-bit, 192-kHz Asynchronous Sample Rate Converter

### Features

- ◆ 175 dB Dynamic Range
- ◆ -140 dB THD+N
- ◆ No Programming Required
- ◆ No External Master Clock Required
- ◆ Supports Sample Rates up to 211 kHz
- ◆ Input/Output Sample Rate Ratios of 7.5:1 to 1:8
- ◆ Master Clock Support for 128 x Fs, 256 x Fs, 384 x Fs, and 512 x Fs (Master Mode)
- ◆ 16-, 20-, 24-, or 32-bit Data I/O
- ◆ 32-bit Internal Signal Processing
- ◆ Dither Automatically Applied and Scaled to Output Resolution
- ◆ Flexible 3-wire Serial Digital Audio Input and Output Ports
- ◆ Master and Slave Modes for Both Input and Output
- ◆ Bypass Mode
- ◆ Time Division Multiplexing (TDM) Mode
- ◆ Attenuates Clock Jitter
- ◆ Multiple Device Outputs are Phase Matched
- ◆ Linear Phase FIR Filter
- ◆ Automatic Soft Mute/Unmute
- ◆ +2.5 V Digital Supply (VD)
- ◆ +3.3 V or 5.0 V Digital Interface (VL)
- ◆ Space-saving 20-pin TSSOP and QFN Packages

The CS8421 supports sample rates up to 211 kHz and is available in 20-pin TSSOP and QFN packages in both Commercial (-10° to +70° C) and Automotive (-40° to +85° C) grades. The CDB8421 Customer Demonstration board is also available for device evaluation and implementation suggestions. Please see [“Ordering Information”](#) on page 36 for complete details.

## General Description

The CS8421 is a 32-bit, high-performance, monolithic CMOS stereo asynchronous sample-rate converter.

Digital audio inputs and outputs can be 32, 24, 20, or 16 bits. Input and output data can be completely asynchronous, synchronous to an external data clock, or the part can operate without any external clock by using an integrated oscillator.

Audio data is input and output through configurable 3-wire input/output ports. The CS8421 does not require any software control via a control port.

Target applications include digital recording systems (DVD-R/RW, CD-R/RW, PVR, DAT, MD, and VTR), digital mixing consoles, high-quality D/A, effects processors, computer audio systems, and automotive audio systems.

The CS8421 is also suitable for use as an asynchronous decimation or interpolation filter. See Cirrus Logic Application Note AN270, *“Audio A/D Conversion with an Asynchronous Decimation Filter”*, available at [www.cirrus.com](http://www.cirrus.com) for more details.

## 1. PIN DESCRIPTIONS

### 1.1 TSSOP PIN DESCRIPTIONS

Pin Name	#	Pin Description
XTO	1	<b>Crystal Out (Output)</b> - Crystal output for Master clock. See <a href="#">“Master Clock” on page 21</a> .
XTI	2	<b>Crystal/Oscillator In (Input)</b> - Crystal or digital clock input for Master clock. See <a href="#">“Master Clock” on page 21</a> .
VD	3	<b>Digital Power (Input)</b> - Digital core power supply. Typically +2.5 V.
GND	4	<b>Ground (Input)</b> - Ground for I/O and core logic.
$\overline{\text{RST}}$	5	<b>Reset (Input)</b> - When $\overline{\text{RST}}$ is low, the CS8421 enters a low-power mode and all internal states are reset. On initial power-up, $\overline{\text{RST}}$ must be held low until the power supply is stable and all input clocks are stable in frequency and phase.
BYPASS	6	<b>Sample Rate Converter Bypass (Input)</b> - When BYPASS is high, the sample rate converter will be bypassed, and any data input through the serial audio input port will be directly output on the serial audio output port. When BYPASS is low, the sample rate converter will operate normally.
ILRCK	7	<b>Serial Audio Input Left/Right Clock (Input/Output)</b> - Word-rate clock for the audio data on the SDIN pin.
ISCLK	8	<b>Serial Audio Bit Clock (Input/Output)</b> - Serial-bit clock for audio data on the SDIN pin.
SDIN	9	<b>Serial Audio Input Data Port (Input)</b> - Audio data serial input pin.
MCLK_OUT	10	<b>Master Clock Output (Output)</b> - Buffered and level-shifted output for Master clock. If MCLK_OUT is not required, this pin should be pulled high through a 47 k $\Omega$ resistor to turn the output off. See <a href="#">“Master Clock” on page 21</a> .
TDM_IN	11	<b>Serial Audio TDM Input (Input)</b> - Time Division Multiplexing serial audio data input. Grounded when not used. See <a href="#">“Time Division Multiplexing (TDM) Mode” on page 22</a> .
SDOUT	12	<b>Serial Audio Output Data Port (Output)</b> - Audio data serial output pin. Optionally this pin may be pulled low through a 47 k $\Omega$ resistor, but should not be pulled high.
OSCLK	13	<b>Serial Audio Bit Clock (Input/Output)</b> - Serial-bit clock for audio data on the SDOUT pin.
OLRCK	14	<b>Serial Audio Input Left/Right Clock (Input/Output)</b> - Word-rate clock for the audio data on the SDOUT pin.
MS_SEL	15	<b>Master/Slave Select (Input)</b> - Used to select Master or Slave for the input and output serial audio ports at startup and reset. See <a href="#">Table 1 on page 19</a> for settings.
GND	16	<b>Ground (Input)</b> - Ground for I/O and core logic.
VL	17	<b>Logic Power (Input)</b> - Input/Output power supply. Typically +3.3 V or +5.0 V.
SAOF	18	<b>Serial Audio Output Format Select (Input)</b> - Used to select the serial audio output format at startup and reset. See <a href="#">Table 3 on page 19</a> for format settings.
SAIF	19	<b>Serial Audio Input Format Select (Input)</b> - Used to select the serial audio input format at startup and reset. See <a href="#">Table 2 on page 19</a> for format settings.
SRC_UNLOCK	20	<b>SRC Unlock Indicator (Output)</b> - Indicates when the SRC is unlocked. See <a href="#">“SRC Locking and Varispeed” on page 20</a> .

**1.2 QFN PIN DESCRIPTIONS**

Pin Name	#	Pin Description
VD	1	<b>Digital Power (Input)</b> - Digital core power supply. Typically +2.5 V.
GND	2	<b>Ground (Input)</b> - Ground for I/O and core logic.
$\overline{\text{RST}}$	3	<b>Reset (Input)</b> - When $\overline{\text{RST}}$ is low, the CS8421 enters a low-power mode and all internal states are reset. On initial power-up, $\overline{\text{RST}}$ must be held low until the power supply is stable and all input clocks are stable in frequency and phase.
BYPASS	4	<b>Sample Rate Converter Bypass (Input)</b> - When BYPASS is high, the sample-rate converter will be bypassed, and any data input through the serial audio input port will be directly output on the serial audio output port. When BYPASS is low, the sample rate converter will operate normally.
ILRCK	5	<b>Serial Audio Input Left/Right Clock (Input/Output)</b> - Word-rate clock for the audio data on the SDIN pin.
ISCLK	6	<b>Serial Audio Bit Clock (Input/Output)</b> - Serial-bit clock for audio data on the SDIN pin.
SDIN	7	<b>Serial Audio Input Data Port (Input)</b> - Audio data serial input pin.
MCLK_OUT	8	<b>Master Clock Output (Output)</b> - Buffered and level-shifted output for Master clock. If MCLK_OUT is not required, this pin should be pulled high through a 47 k $\Omega$ resistor to turn the output off. See <a href="#">“Master Clock” on page 21</a> .
TDM_IN	9	<b>Serial Audio TDM Input (Input)</b> - Time Division Multiplexing serial audio data input. Grounded when not used. See <a href="#">“Time Division Multiplexing (TDM) Mode” on page 22</a> .
SDOUT	10	<b>Serial Audio Output Data Port (Output)</b> - Audio data serial output pin. Optionally this pin may be pulled low through a 47 k $\Omega$ resistor, but should not be pulled high.
OSCLK	11	<b>Serial Audio Bit Clock (Input/Output)</b> - Serial bit clock for audio data on the SDOUT pin.
OLRCK	12	<b>Serial Audio Input Left/Right Clock (Input/Output)</b> - Word rate clock for the audio data on the SDOUT pin.
MS_SEL	13	<b>Master/Slave Select (Input)</b> - Used to select Master or Slave for the input and output serial audio ports at startup and reset. See <a href="#">Table 1 on page 19</a> for settings.
GND	14	<b>Ground (Input)</b> - Ground for I/O and core logic.
VL	15	<b>Logic Power (Input)</b> - Input/Output power supply. Typically +3.3 V or +5.0 V.
SAOF	16	<b>Serial Audio Output Format Select (Input)</b> - Used to select the serial audio output format at startup and reset. See <a href="#">Table 3 on page 19</a> for format settings.
SAIF	17	<b>Serial Audio Input Format Select (Input)</b> - Used to select the serial audio input format at startup and reset. See <a href="#">Table 2 on page 19</a> for format settings.
SRC_UNLOCK	18	<b>SRC Unlock Indicator (Output)</b> - Indicates when the SRC is unlocked. See <a href="#">“SRC Locking and Varispeed” on page 20</a> .
XTO	19	<b>Crystal Out (Output)</b> - Crystal output for Master clock. See <a href="#">“Master Clock” on page 21</a> .
XTI	20	<b>Crystal/Oscillator In (Input)</b> - Crystal or digital clock input for Master clock. See <a href="#">“Master Clock” on page 21</a> .
Thermal Pad	-	<b>Thermal Pad</b> - Thermal relief pad for optimized heat dissipation. This pad must be electrically connected to GND. See <a href="#">“Power Supply, Grounding, and PCB Layout” on page 24</a> for more information.

## 2. CHARACTERISTICS AND SPECIFICATIONS

(All Min/Max characteristics and specifications are guaranteed over the Specified Operating Conditions. Typical performance characteristics and specifications are derived from measurements taken at nominal supply voltages and  $T_A = 25^\circ\text{C}$ .)

### SPECIFIED OPERATING CONDITIONS

(GND = 0 V, all voltages with respect to 0 V)

Parameter	Symbol	Min	Nominal	Max	Units	
Power Supply Voltage	VD	2.38	2.5	2.62	V	
	VL	3.14	3.3 or 5.0	5.25	V	
Ambient Operating Temperature:	'-CZ'	$T_A$	-10	-	+70	$^\circ\text{C}$
	'-CNZ'		-10	-	+70	$^\circ\text{C}$
	'-DZ'		-40	-	+85	$^\circ\text{C}$

### ABSOLUTE MAXIMUM RATINGS

(GND = 0 V; all voltages with respect to 0 V. Operation beyond these limits may result in permanent damage to the device. Normal operation is not guaranteed at these extremes.)

Parameter	Symbol	Min	Max	Units
Power Supply Voltage	VD	-0.3	3.5	V
	VL	-0.3	6.0	V
Input Current, Any Pin Except Supplies	$I_{in}$	-	$\pm 10$	mA
Input Voltage	$V_{in}$	-0.3	VL+0.4	V
Ambient Operating Temperature (power applied)	$T_A$	-55	+125	$^\circ\text{C}$
Storage Temperature	$T_{stg}$	-65	+150	$^\circ\text{C}$

#### Notes:

1. Transient currents of up to 100 mA will not cause SCR latch-up.
2. Numbers separated by a colon indicate input and output sample rates. For example, 48 kHz:96 kHz indicates that  $F_{si} = 48 \text{ kHz}$  and  $F_{so} = 96 \text{ kHz}$ .

## PERFORMANCE SPECIFICATIONS

(XTI/XTO = 27 MHz; Input signal = 1.000 kHz, 0 dBFS, Measurement Bandwidth = 20 to Fso/2 Hz, and Word Width = 32-Bits, unless otherwise stated.)

Parameter		Min	Typ	Max	Units
Resolution		16	-	32	bits
Sample Rate with XTI = 27.000 MHz	Slave	7.2	-	207	kHz
	Master	53	-	211	kHz
Sample Rate with other XTI clocks	Slave	XTI/3750	-	XTI/130	kHz
	Master	XTI/512	-	XTI/128	kHz
Sample Rate with ring oscillator (XTI to GND or VL, XTO floating)		12	-	96	kHz
Sample Rate Ratio - Upsampling		-	-	1:8	
Sample Rate Ratio - Downsampling		-	-	7.5:1	
Gain Error		-0.2	-	-0.02	dB
Interchannel Gain Mismatch		-	0.0	-	dB
Interchannel Phase Deviation		-	0.0	-	Degrees
Peak Idle Channel Noise Component (32-bit operation)		-	-	-192	dBFS
<b>Dynamic Range (20 Hz to Fso/2, 1 kHz, -60 dBFS Input)</b>					
44.1 kHz:48 kHz	A-Weighted	-	180	-	dB
	Unweighted	-	177	-	dB
44.1 kHz:192 kHz	A-Weighted	-	175	-	dB
	Unweighted	-	172	-	dB
48 kHz:44.1 kHz	A-Weighted	-	180	-	dB
	Unweighted	-	177	-	dB
48 kHz:96 kHz	A-Weighted	-	179	-	dB
	Unweighted	-	176	-	dB
96 kHz:48 kHz	A-Weighted	-	176	-	dB
	Unweighted	-	173	-	dB
192 kHz:32 kHz	A-Weighted	-	175	-	dB
	Unweighted	-	172	-	dB
<b>Total Harmonic Distortion + Noise (20 Hz to Fso/2, 1 kHz, 0 dBFS Input)</b>					
32 kHz:48 kHz		-	-161	-	dB
44.1 kHz:48 kHz		-	-171	-	dB
44.1 kHz:192 kHz		-	-130	-	dB
48 kHz:44.1 kHz		-	-160	-	dB
48 kHz:96 kHz		-	-148	-	dB
96 kHz:48 kHz		-	-168	-	dB
192 kHz:32 kHz		-	-173	-	dB

## DIGITAL FILTER CHARACTERISTICS

Parameter	Min	Typ	Max	Units
Passband (Upsampling or Downsampling)	-	-	$0.4535 \cdot F_{so}$	Hz
Passband Ripple	-	-	$\pm 0.007$	dB
Stopband	$0.5465 \cdot F_{so}$	-	-	Hz
Stopband Attenuation	125	-	-	dB
Group Delay	SRC Mode	(Note 3)	-	s
	Bypass Mode	-	$3/F_{si}$	s

3. The equation for the group delay through the sample-rate converter is  $(56.581 / F_{si}) + (55.658 / F_{so})$ . For example, if the input sample rate is 192 kHz and the output sample rate is 96 kHz, the group delay through the sample-rate converter is  $(56.581/192,000) + (55.658/96,000) = .875$  milliseconds.

## DC ELECTRICAL CHARACTERISTICS

(GND = 0 V; all voltages with respect to 0 V.)

Parameters	Symbol	Min	Typ	Max	Units
<b>Power-Down Mode (Note 4)</b>					
Supply Current in power-down (Oscillator attached to XTI-XTO)	VD		50		$\mu$ A
	VL = 3.3 V		100		$\mu$ A
	VL = 5.0 V		200		$\mu$ A
Supply Current in power-down (Crystal attached to XTI-XTO)	VD		100		$\mu$ A
	VL = 3.3 V		1.5		mA
	VL = 5.0 V		4		mA
<b>Normal Operation (Note 5)</b>					
Supply Current at 48 kHz $F_{si}$ and $F_{so}$ (Oscillator attached to XTI-XTO)	VD		24		mA
	VL = 3.3 V		2.5		mA
	VL = 5.0 V		4		mA
Supply Current at 192 kHz $F_{si}$ and $F_{so}$ (Oscillator attached to XTI-XTO)	VD		80		mA
	VL = 3.3 V		8		mA
	VL = 5.0 V		13		mA
Supply Current at 48 kHz $F_{si}$ and $F_{so}$ (Crystal attached to XTI-XTO)	VD		24		mA
	VL = 3.3 V		3		mA
	VL = 5.0 V		7		mA
Supply Current at 192 kHz $F_{si}$ and $F_{so}$ (Crystal attached to XTI-XTO)	VD		80		mA
	VL = 3.3 V		4		mA
	VL = 5.0 V		6.5		mA

4. Power Down Mode is defined as  $\overline{RST} = \text{LOW}$  with all clocks and data lines held static, except when a crystal is attached across XTI-XTO, in which case the crystal will begin oscillating.
5. Normal operation is defined as  $\overline{RST} = \text{HI}$ .

## DIGITAL INPUT CHARACTERISTICS

Parameters	Symbol	Min	Typ	Max	Units
Input Leakage Current	$I_{in}$	-	-	$\pm 10$	$\mu A$
Input Capacitance	$I_{in}$	-	8	-	pF
Input Hysteresis		-	250	-	mV

## DIGITAL INTERFACE SPECIFICATIONS

(GND = 0 V; all voltages with respect to 0 V.)

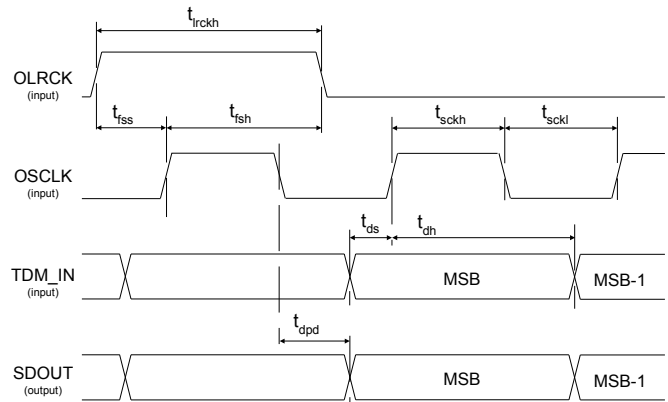

Parameters	Symbol	Min	Max	Units
High-Level Output Voltage, except MCLK_OUT and SDOUT ( $I_{OH}=4$ mA)	$V_{OH}$	$0.77 \times VL$	-	V
Low-Level Output Voltage, except MCLK_OUT and SDOUT ( $I_{OL}=4$ mA)	$V_{OL}$	-	.6	V
High-Level Output Voltage, MCLK_OUT ( $I_{OH}=6$ mA)	$V_{OH}$	$0.77 \times VL$	-	V
Low-Level Output Voltage, MCLK_OUT ( $I_{OL}=6$ mA)	$V_{OL}$	-	.6	V
High-Level Output Voltage, SDOUT ( $I_{OH}=8$ mA)	$V_{OH}$	$0.77 \times VL$	-	V
Low-Level Output Voltage, SDOUT ( $I_{OL}=8$ mA)	$V_{OL}$	-	.65	V
High-Level Input Voltage	$V_{IH}$	$0.6 \times VL$	$VL+0.3$	V
Low-Level Input Voltage	$V_{IL}$	-0.3	0.8	V

## SWITCHING SPECIFICATIONS

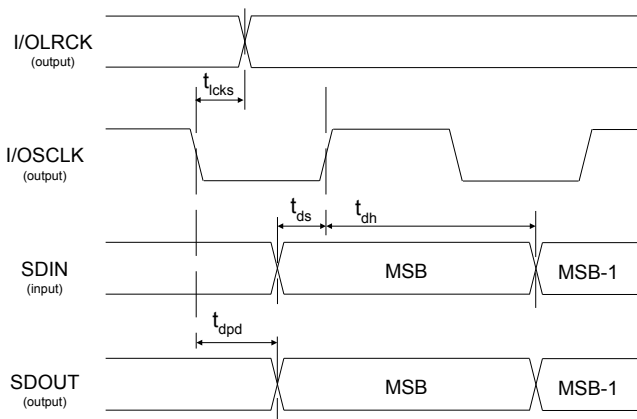

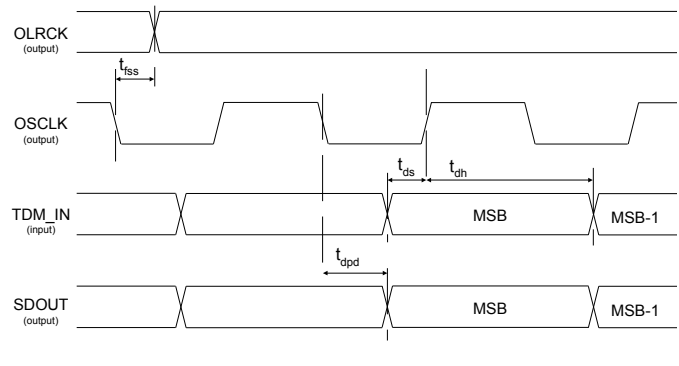

(Inputs: Logic 0 = 0 V, Logic 1 = VL;  $C_L = 20$  pF)

Parameters	Symbol	Min	Max	Units
RST pin Low Pulse Width (Note 6)		1	-	ms
XTI Frequency (Note 7)	Crystal	16.384	27.000	MHz
	Digital Clock Source	1.024	27.000	MHz
XTI Pulse Width High/Low		14.8	-	ns
MCLK_OUT Duty Cycle		45	55	%
<b>Slave Mode</b>				
I/OSCLK Frequency		-	24.576	MHz
OLRCK High Time (Note 8)	$t_{irckh}$	326	-	ns

### 3. TYPICAL CONNECTION DIAGRAMS

**Figure 5. Typical Connection Diagram, No External Master Clock**

\* When no external master clock is supplied to the part, both input and output must be set to Slave Mode for the part to operate properly. This is done by connecting the MS\_SEL pin to ground through a resistance of 0 Ω to 1 kΩ + 1% as stated in [Table 1, “Serial Audio Port Master/Slave and Clock Ratio Select Start-Up Options \(MS\\_SEL\),” on page 19.](#)

\*\* The connection (VL or GND) and value of these two resistors determines the mode of operation for the input and output serial ports as described in [Table 2 on page 19](#) and [Table 3 on page 19.](#)

**Figure 6. Typical Connection Diagram, Master and Slave Modes**

\* The connection (VL or GND) and value of these three resistors determines the mode of operation for the input and output serial ports as described in [Table 1 Serial Audio Port Master/Slave and Clock Ratio Select Start-Up Options \(MS\\_SEL\)](#), and [Table 2, “Serial Audio Input Port Start-Up Options \(SAIF\),”](#) on page 19 and [Table 3, “Serial Audio Output Port Start-Up Options \(SAOF\),”](#) on page 19.

\*\* MCLK\_OUT pin should be pulled high through a 47 kΩ resistor if an MCLK output is not needed.

## 4. APPLICATIONS

The CS8421 is a 32-bit, high-performance, monolithic CMOS stereo asynchronous sample-rate converter.

The digital audio data is input and output through configurable 3-wire serial ports. The digital audio input/output ports offer Left-Justified, Right-Justified, and I<sup>2</sup>S serial audio formats. The CS8421 also supports a TDM Mode which allows multiple channels of digital audio data on one serial line. A Bypass Mode allows the data to be passed directly to the output port without sample rate conversion.

The CS8421 does not require a control port interface, helping to speed design time by not requiring the user to develop software to configure the part. Pins that are sensed after reset allow the part to be configured. See “Reset, Power-Down, and Start-Up” on page 23.

Target applications include digital recording systems (DVD-R/RW, CD-R/RW, PVR, DAT, MD, and VTR), digital mixing consoles, high quality D/A, effects processors and computer audio systems.

Figure 5 and 6 show the supply and external connections to the CS8421.

### 4.1 Three-wire Serial input/Output Audio Port

A 3-wire serial audio input/output port is provided. The interface format should be chosen to suit the attached device through the MS\_SEL, SAIF, and SAOF pins. Tables 1, 2, and 3 show the pin functions and their corresponding settings. The following parameters are adjustable:

- Master or Slave
- Master clock (MCLK) frequencies of  $128 \cdot F_{si/o}$ ,  $256 \cdot F_{si/o}$ ,  $384 \cdot F_{si/o}$ , and  $512 \cdot F_{si/o}$  (Master Mode)
- Audio data resolution of 16-, 20-, 24-, or 32-bits
- Left- or Right-Justification of the data relative to left/right clock (LRCK) as well as I<sup>2</sup>S

Figures 7, 8, and 9 show the input/output formats available.

In Master Mode, the left/right clock and the serial bit clock are outputs, derived from the XTI input pin master clock.

In Slave Mode, the left/right clock and the serial bit clock are inputs and may be asynchronous to the XTI master clock. The left/right clock should be continuous, but the duty cycle can be less than 50% if enough serial clocks are present in each phase to clock all of the data bits.

ISCLK is always set to  $64 \cdot F_{si}$  when the input is set to master. In normal operation, OSCLK is set to  $64 \cdot F_{so}$ . In TDM Slave Mode, OSCLK must operate at  $N \cdot 64 \cdot F_{so}$ , where N is the number of CS8421's connected together. In TDM Master Mode, OSCLK is set to  $256 \cdot F_{so}$

For more information about serial audio formats, refer to the Cirrus Logic applications note AN282, “The 2-Channel Serial Audio Interface: A Tutorial”, available at [www.cirrus.com](http://www.cirrus.com).

**Figure 7. Serial Audio Interface Format - I<sup>2</sup>S**

**Figure 8. Serial Audio Interface Format - Left-Justified**

**Figure 9. Serial Audio Interface Format - Right-Justified**

## 4.2 Mode Selection

The CS8421 uses the resistors attached to the MS\_SEL, SAIF, and SAOF pins to determine the modes of operation. After reset, the resistor value and condition (VL or GND) are sensed. This operation will take approximately 4  $\mu$ s to complete. The SRC\_UNLOCK pin will remain high and the SDOUT pin will be muted until the mode detection sequence has completed. After this, if all clocks are stable, SRC\_UNLOCK will be brought low when audio output is valid and normal operation will occur. [Tables 1, 2, and 3](#) show the pin functions and their corresponding settings. If the 1.0 k $\Omega$  option is selected for MS\_SEL, SAIF, or SAOF, the resistor connected to that pin may be replaced by a direct connection to VL or GND as appropriate.

The resistor attached to each mode-selection pin should be placed physically close to the CS8421. The end of the resistor not connected to the mode selection pins should be connected as close as possible to VL and GND to minimize noise. [Tables 1, 2, and 3](#) show the pin functions and their corresponding settings.

MS_SEL pin	Input M/S	Output M/S
1.0 kΩ ± 1% to GND	Slave	Slave
1.96 kΩ ± 1% to GND	Slave	Master (128 x Fso)
4.02 kΩ ± 1% to GND	Slave	Master (256 x Fso)
8.06 kΩ ± 1% to GND	Slave	Master (384 x Fso)
16.2 kΩ ± 1% to GND	Slave	Master (512 x Fso)
1.0 kΩ ± 1% to VL	Master (128 x Fsi)	Slave
1.96 kΩ ± 1% to VL	Master (256 x Fsi)	Slave
4.02 kΩ ± 1% to VL	Master (384 x Fsi)	Slave
8.06 kΩ ± 1% to VL	Master (512 x Fsi)	Slave

32.4 kΩ ± 1% to VL	TDM Mode 20-bit data
63.4 kΩ ± 1% to VL	TDM Mode 24-bit data
127.0 kΩ ± 1% to VL	TDM Mode 32-bit data

**Table 3. Serial Audio Output Port Start-Up Options (SAOF)**

### 4.3 Sample Rate Converter (SRC)

Multirate digital signal processing techniques are used to conceptually upsample the incoming data to a very high rate and then downsample to the outgoing rate. The internal data path is 32-bits wide even if a lower bit depth is selected at the output. The filtering is designed so that a full input audio bandwidth of 20 kHz is preserved if the input sample and output sample rates are greater than or equal to 44.1 kHz. When the output sample rate becomes less than the input sample rate, the input is automatically band-limited to avoid aliasing products in the output. Careful design ensures minimum ripple and distortion products are added to the incoming signal. The SRC also determines the ratio between the incoming and outgoing sample rates and sets the filter corner frequencies appropriately. Any jitter in the incoming signal has little impact on the dynamic performance of the rate converter and has no influence on the output clock.

#### 4.3.1 Data Resolution and Dither

When using the serial audio input port in Left-Justified and I<sup>2</sup>S Modes, all input data is treated as 32-bits wide. Any truncation that has been done prior to the CS8421 to less than 32-bits should have been done using an appropriate dithering process. If the serial audio input port is in Right-Justified Mode, the input data will be truncated to the bit depth set by SAIF pin setting. If the SAIF bit depth is set to 16-, 20-, or 24-bits, and the input data is 32-bits wide, truncation distortion will occur. Similarly, in any serial audio input port mode, if an inadequate number of bit clocks are entered (i.e. 16 clocks instead of 20 clocks), the input words will be truncated, causing truncation distortion at low levels. In summary, there is no dithering mechanism on the input side of the CS8421, and care must be taken to ensure that no truncation occurs.

Dithering is used internally where appropriate inside the SRC block.

The output side of the SRC can be set to 16-, 20-, 24-, or 32-bits. Dithering is applied and is automatically scaled to the selected output word length. This dither is not correlated between left and right channels.

#### 4.3.2 SRC Locking and Varispeed

The SRC calculates the ratio between the input sample rate and the output sample rate and uses this information to set up various parameters inside the SRC block. The SRC takes some time to make this calculation, approximately  $4200/F_{so}$  (87.5 ms at  $F_{so}$  of 48 kHz).

If  $F_{si}$  is changing, as in a varispeed application, the SRC will track the incoming sample rate. During this tracking mode, the SRC will still rate convert the audio data, but at increased distortion levels. Once the incoming sample rate is stable, the SRC will return to normal levels of audio quality. The data buffer in the SRC can overflow if the input sample rate changes at greater than 10%/sec. There is no provision for varispeed applications where  $F_{so}$  is changing.

The SRC\_UNLOCK pin is used to indicate when the SRC is not locked. When  $\overline{RST}$  is asserted, or if there is a change in  $F_{si}$  or  $F_{so}$ , SRC\_UNLOCK will be set high. The SRC\_UNLOCK pin will continue to be high until the SRC has reacquired lock and settled, at which point it will transition low. When the SRC\_UNLOCK pin is set low, SDOOUT is outputting valid audio data. This can be used to signal a DAC to unmute its output.

#### 4.3.3 Bypass Mode

When the BYPASS pin is set high, the input data bypasses the sample rate converter and is sent directly to the serial audio output port. No dithering is performed on the output data. This mode is ideal for passing non-audio data through without a sample-rate conversion. ILRCK and OLRCK should be the same sample rate and synchronous in this mode. The group delay in this mode is greatly reduced from normal SRC mode as noted in the [“Digital Filter Characteristics” on page 12](#).

#### 4.3.4 Muting

The SDOUT pin is set to all zero output (full mute) immediately after the  $\overline{\text{RST}}$  pin is set high. When the output from the SRC becomes valid, though the SRC may not have reached full performance, SDOUT is unmuted over a period of approximately 4096 OLRCK cycles (soft unmuted). When the output becomes invalid, depending on the condition, SDOUT is either immediately set to all zero output (hard muted) or SDOUT is muted over a period of approximately 4096 OLRCK cycles until it reaches full mute (soft muted). The SRC will soft mute SDOUT if there is an illegal ratio between ILRCK and the XTI master clock. Conditions that will cause the SRC to hard mute SDOUT include removing OLRCK, the  $\overline{\text{RST}}$  pin being set low, or illegal ratios between OLRCK and the XTI master clock. After all invalid states have been cleared, the SRC will soft unmute SDOUT.

#### 4.3.5 Group Delay and Phase Matching Between Multiple CS8421 Parts

The equation for the group delay through the sample rate converter is shown in “[Digital Filter Characteristics](#)” on page 12. This phase delay is equal across multiple parts. Therefore, when multiple parts operate at the same Fsi and Fso and use a common XTI/XTO clock, their output data is phase matched.

#### 4.3.6 Master Clock

The CS8421 uses the clock signal supplied through XTI as its master clock (MCLK). MCLK can be supplied from a digital clock source, a crystal oscillator, or a fundamental mode crystal. [Figure 10](#) shows the typical connection diagram for using a fundamental mode crystal. Please refer to the crystal manufacturer’s specifications for the external capacitor recommendations. If XTO is not used, such as with a digital clock source or crystal oscillator, XTO should be left unconnected or pulled low through a 47 kΩ resistor to GND.

If either serial audio port is set as master, MCLK will be used to supply the sub-clocks to the master SCLK and LRCK. In this case, MCLK will be synchronous to the master serial audio port. If both serial audio ports are set as slave, MCLK can be asynchronous to either or both ports. If the user needs to change the clock source to XTI while the CS8421 is still powered on and running, a RESET must be issued once the XTI clock source is present and valid to ensure proper operation.

When both serial ports are configured as slave and operating at sample rates less than 96 kHz, the CS8421 has the ability to operate without a master clock input through XTI. This benefits the design by not requiring extra external clock components (lowering production cost) and not requiring a master clock to be routed to the CS8421, resulting in lowered noise contribution in the system. In this mode, an internal oscillator provides the clock to run all of the internal logic. To enable the internal oscillator, simply tie XTI to GND or VL. In this mode, XTO should be left unconnected.

The CS8421 can also provide a buffered MCLK output through the MCLK\_OUT pin. This pin can be used to supply MCLK to other system components that operate synchronously to MCLK. If MCLK\_OUT is not needed, the output of the pin can be disabled by pulling the pin high through a 47 kΩ resistor to VL. MCLK\_OUT is also disabled when using the internal oscillator mode. The MCLK\_OUT pin will be set low when disabled by using the internal oscillator mode.

### 4.3.7 Clocking

In order to ensure proper operation of the CS8421, the clock or crystal attached to XTI must simultaneously satisfy the requirements of L<sub>RCK</sub> for both the input and output as follows:

- If the input is set to master,  $F_{si} \leq XTI/128$  and  $F_{so} \leq XTI/130$ .
- If the output is set to master,  $F_{so} \leq XTI/128$  and  $F_{si} \leq XTI/130$ .
- If both input and output are set to slave,  $XTI \geq 130 * [\text{maximum}(F_{si}, F_{so})]$ ,  $XTI/F_{si} < 3750$ , and  $XTI/F_{so} < 3750$ .

Figure 10. Typical Connection Diagram for Crystal Circuit

## 4.4 Time Division Multiplexing (TDM) Mode

TDM Mode allows several CS8421 to be serially connected together allowing their corresponding SDO<sub>UT</sub> data to be multiplexed onto one line for input into a DSP or other TDM-capable multichannel device.

The CS8421 can operate in two TDM modes. The first mode consists of all of the CS8421's output ports set to slave, as shown in Figure 13. The second mode consists of one CS8421 output port set to master and the remaining CS8421's output ports set to slave, as shown in Figure 14.

The TDM\_IN pin is used to input the data, while the SDO<sub>UT</sub> pin is used to output the data. The first CS8421 in the chain should have its TDM\_IN set to GND. Data is transmitted from SDO<sub>UT</sub> most significant bit first on the first OSCLK falling edge after an OLRCK transition and is valid on the rising edge of OSCLK.

In TDM Slave Mode, the number of channels that can be multiplexed to one serial data line depends on the output sampling rate. For Slave Mode, OSCLK must operate at  $N * 64 * F_{so}$ , where N is the number of CS8421's connected together. The maximum allowable OSCLK frequency is 24.576 MHz, so for  $F_{so} = 48$  kHz,  $N = 8$  (16 channels of serial audio data).

In TDM Master Mode, OSCLK operates at  $256 * F_{so}$ , which is equivalent to  $N = 4$ , so a maximum of 8 channels of digital audio can be multiplexed together. Note that for TDM Master Mode, MCLK must be at least  $256 * F_{so}$ , where  $F_{so} \leq 96$  kHz. OLRCK identifies the start of a new frame. Each time-slot is 32-bits wide, with the valid data sample left-justified within the time-slot. Valid data lengths are 16-, 20-, 24- or 32-bits. Figures 11 and 12 show the interface format for Master and Slave TDM Modes with a 32-bit word-length.

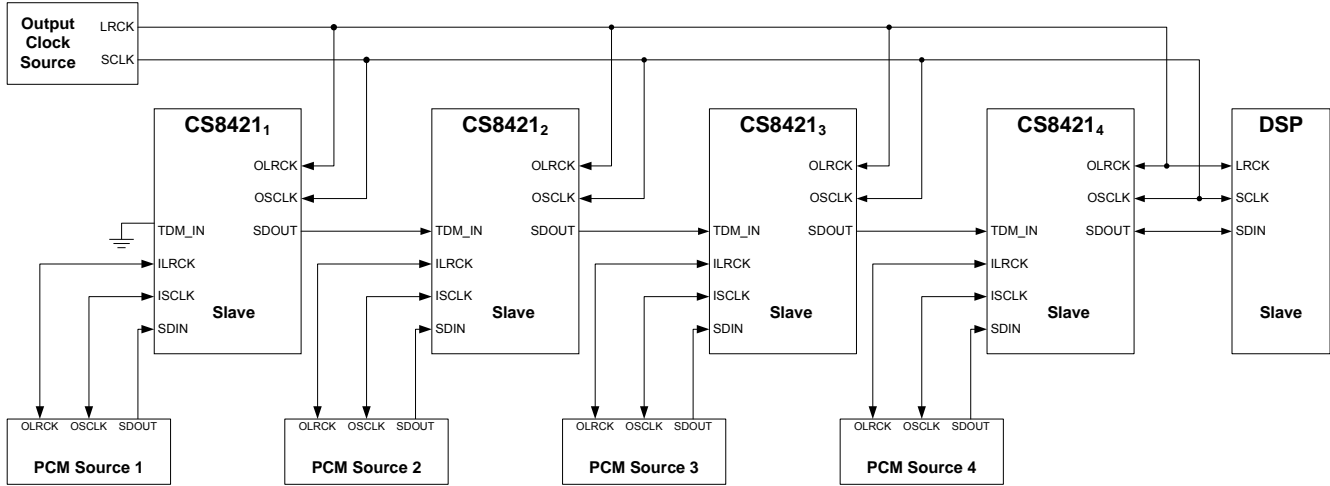

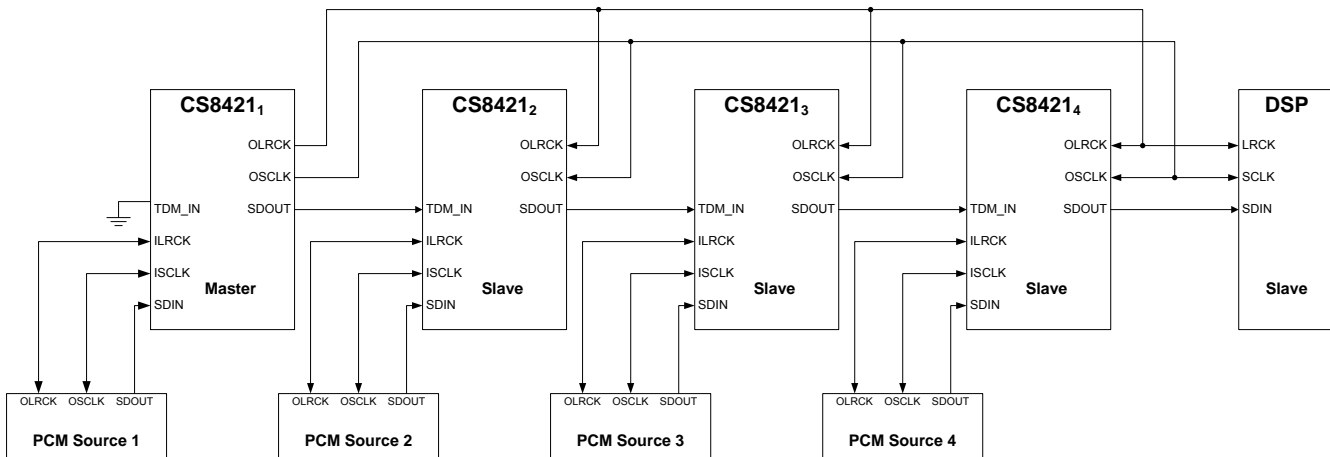

Figure 11. TDM Slave Mode Timing Diagram

**Figure 12. TDM Master Mode Timing Diagram**

**Figure 13. TDM Mode Configuration (All CS8421 Outputs are Slave)**

**Figure 14. TDM Mode Configuration (First CS8421 Output is Master, All Others are Slave)**

#### 4.5 Reset, Power-Down, and Start-Up

When  $\overline{\text{RST}}$  is low, the CS8421 enters a low-power mode, all internal states are reset, and the outputs are disabled. After  $\overline{\text{RST}}$  transitions from low to high, the part senses the resistor value on the configuration pins (MS\_SEL, SAIF, and SAOF) and sets the appropriate mode of operation. After the mode has been set (approximately 4  $\mu\text{s}$ ), the part is set to normal operation and all outputs are functional.

---

## 4.6 Power Supply, Grounding, and PCB Layout

The CS8421 operates from a  $V_D = +2.5\text{ V}$  and  $V_L = +3.3\text{ V}$  or  $+5.0\text{ V}$  supply. These supplies may be set independently. Follow normal supply decoupling practices; see [Figure 6](#).

Extensive use of power and ground planes, ground-plane fill in unused areas, and surface-mount decoupling capacitors are recommended. Decoupling capacitors should be mounted on the same side of the board as the CS8421 to minimize inductance effects, and all decoupling capacitors should be as close to the CS8421 as possible. The pin of the configuration resistors not connected to MS\_SEL, SAIF, and SAOF should be connected as close as possible to  $V_L$  or GND.

The CS8421 is available in the compact QFN package. The underside of the QFN package reveals a metal pad that serves as a thermal relief to provide for optimal heat dissipation. This pad must mate with an equally dimensioned copper pad on the PCB and must be electrically connected to ground. A series of vias should be used to connect this copper pad to one or more larger ground planes on other PCB layers.

All performance plots represent typical performance. Measurements for all performance plots were taken under the following conditions, unless otherwise stated:

- VD = 2.5 V, VL = 3.3 V
- Serial Audio Input port set to slave
- Serial Audio Output port set to slave
- Input and output clocks and data are asynchronous
- XT1/XTO = 27 MHz
- Input signal = 1.000 kHz, 0 dBFS
- Measurement Bandwidth = 20 to (Fso/2) Hz
- Word Width = 24 Bits

## 6. PACKAGE DIMENSIONS

### 20L TSSOP (4.4 MM BODY) PACKAGE DRAWING

DIM	INCHES			MILLIMETERS			NOTE
	MIN	NOM	MAX	MIN	NOM	MAX	
A	--	--	0.043	--	--	1.10	
A1	0.002	0.004	0.006	0.05	--	0.15	
A2	0.03346	0.0354	0.037	0.85	0.90	0.95	
b	0.00748	0.0096	0.012	0.19	0.245	0.30	2,3
D	0.252	0.256	0.259	6.40	6.50	6.60	1
E	0.248	0.2519	0.256	6.30	6.40	6.50	
E1	0.169	0.1732	0.177	4.30	4.40	4.50	1
e	--	--	0.026	--	--	0.65	
L	0.020	0.024	0.028	0.50	0.60	0.70	
μ	0°	4°	8°	0°	4°	8°	

**JEDEC #: MO-153**

Controlling Dimension is Millimeters.

**Notes:**

1. "D" and "E1" are reference datums and do not include mold flash or protrusions, but do include mold mismatch and are measured at the parting line, mold flash or protrusions shall not exceed 0.20 mm per side.
2. Dimension "b" does not include dambar protrusion/intrusion. Allowable dambar protrusion shall be 0.13 mm total in excess of "b" dimension at maximum material condition. Dambar intrusion shall not reduce dimension "b" by more than 0.07 mm at least material condition.
3. These dimensions apply to the flat section of the lead between 0.10 and 0.25 mm from lead tips.

### TSSOP THERMAL CHARACTERISTICS

Parameter	Symbol	Min	Typ	Max	Units
Junction to Ambient Thermal Impedance	2 Layer Board	-	48	-	°C/Watt
	4 Layer Board	-	38	-	°C/Watt

## 20-PIN QFN (5 × 5 MM BODY) PACKAGE DRAWING

DIM	INCHES			MILLIMETERS			NOTE
	MIN	NOM	MAX	MIN	NOM	MAX	
A	--	--	0.0394	--	--	1.00	1
A1	0.0000	--	0.0020	0.00	--	0.05	1

E	0.1969 BSC			5.00 BSC			1
E2	0.1202	0.1221	0.1241	3.05	3.10	3.15	1
e	0.0256 BSC			0.65 BSC			1
L	0.0197	0.0236	0.0276	0.50	0.60	0.70	1

### JEDEC #: MO-220

Controlling Dimension is Millimeters.

1. Dimensioning and tolerance per ASME Y 14.5M-1995.
2. Dimensioning lead width applies to the plated terminal and is measured between 0.23mm and 0.33mm from the terminal tip.

## QFN THERMAL CHARACTERISTICS

Parameter	Symbol	Min	Typ	Max	Units
Junction to Ambient Thermal Impedance	$\theta_{JA}$	-	128	-	°C/Watt
		-	35	-	°C/Watt

## 7. ORDERING INFORMATION

### ORDERING INFORMATION

Product	Description	Package	Pb-Free	Temp Range	Container	Order#
CS8421	32-bit Asynchronous Sample Rate Converter	20-TSSOP	YES	-10° to +70°C	Rail	CS8421-CZZ
		20-QFN			Tape and Reel	CS8421-CZZR
					Rail	CS8421-CNZ
		Tape and Reel			CS8421-CNZR	
		20-TSSOP		Rail	CS8421-DZZ	
				Tape and Reel	CS8421-DZZR	
CDB8421	Evaluation Board for CS8421	-	-	-	CDB8421	

## 8. REVISION HISTORY

Release	Changes
F1	Final Release
F2	-Updated Thermal Pad pin description in “QFN Pin Descriptions” on page 8. -Updated “Power Supply, Grounding, and PCB Layout” on page 24.
F3	-Added “Gain Error” to “Performance Specifications” on page 11. -Added group delay specification for Bypass Mode to “Digital Filter Characteristics” on page 12.
F4	Corrected 8.75ms to 87.5ms in “The SRC takes some time to make this calculation, approximately 4200/Fso (87.5 ms at Fso of 48 kHz).” in Section 4.3.2 SRC Locking and Varispeed “

### Contacting Cirrus Logic Support

For all product questions and inquiries, contact a Cirrus Logic Sales Representative.

To find the one nearest to you, go to [www.cirrus.com](http://www.cirrus.com).

#### IMPORTANT NOTICE

Cirrus Logic, Inc. and its subsidiaries (“Cirrus”) believe that the information contained in this document is accurate and reliable. However, the information is subject to change without notice and is provided “AS IS” without warranty of any kind (express or implied). Customers are advised to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, indemnification, and limitation of liability. No responsibility is assumed by Cirrus for the use of this information, including use of this information as the basis for manufacture or sale of any items, or for infringement of patents or other rights of third parties.
