Single, Dual, and Quad Micropower, Low Drift, RRIO Operational Amplifiers

ISL28130, ISL28230, ISL28430

The ISL28130, ISL28230 and ISL28430 are single, dual and quad micropower, low drift operational amplifiers that are optimized for single and dual supply operation from 1.65V to 5.5V and ±0.825V to ±2.75V. Their low supply current of 20µA and wide input range enable the ISL28130, ISL28230, ISL28430 to be an excellent general purpose op amp for a range of applications. The ISL28130, ISL28230 and ISL28430 are ideal for handheld devices that operate off 2 AA or single Li-ion batteries.

The ISL28130 is available in industry standard pinouts for 5 Ld SOT-23, 5 Ld SC70 and 8 Ld SOIC packages. The ISL28230 is available in industry standard pinouts for 8 Ld MSOP and 8Ld SOIC packages. The ISL28430 is available in 14 Ld TSSOP and 14 Ld SOIC packages. All devices operate over the temperature range of 0°C to +70°C.

Features

- Low Input Offset Voltage . . . . . 40µV, Max.
- Low Offset Drift . . . . . 150nV/°C, Max
- Input Bias Current . . . . . 250 pA, Max.
- Quiescent Current (Per Amplifier) . . . . . 20µA, Typ.
- Single Supply Range . . . . . +1.65V to +5.5V
- Dual Supply Range . . . . . ±0.825V to ±2.75V
- Low Noise (0.01Hz to 10Hz) . . . . . 1.1µV_{P-P}, Typ.
- Rail-to-Rail Inputs and Output
- Operating Temperature Range . . . . . 0°C to +70°C

Applications* (see page 11)

- Bi-Directional Current Sense
- Temperature Measurement
- Medical Equipment
- Electronic Weigh Scales
- Precision/Strain Gauge Sensor
- Precision Regulation
- Low Ohmic Current Sense
- High Gain Analog Front Ends

NOTES:

1. Please refer to TB347 for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for ISL28130, ISL28230, ISL28430. For more information on MSL please see techbrief TB363.

Applications Information

Functional Description

The ISL28130, ISL28230 and ISL28430 are low offset low drift operational amplifiers with a very high open loop gain (150dB). The ISL28130, ISL28230 and ISL28430 operate on a single supply range of 1.65V to 5.5V or dual supply range of ±0.825V to ±2.75V while consuming only 20µA of supply current per channel. The ISL28130, ISL28230 and ISL28430 has a 400kHz gain-bandwidth.

The high open loop gain, low offset voltage, high bandwidth and low 1/f noise make the ISL28130, ISL28230 and ISL28430 ideal for precision applications.

Rail-to-rail Input and Output (RRIO)

The RRIO CMOS amplifier uses parallel input PMOS and NMOS that enable the inputs to swing 100mV beyond either supply rail. The inverting and non-inverting inputs do not have back-to-back input clamp diodes and are capable of maintaining high input impedance at high differential input voltages. This is effective in eliminating output distortion caused by high slew-rate input signals.

The output stage uses common source connected PMOS and NMOS devices to achieve rail-to-rail output drive capability with 15mA current limit and the capability to swing to within 50mV of either rail while driving a 10kΩ load.

IN+ and IN- Protection

All input terminals have internal ESD protection diodes to both positive and negative supply rails, limiting the input voltage to within one diode beyond the supply rails. For applications where either input is expected to exceed the rails by 0.5V, an external series resistor must be used to ensure the input currents never exceed 20mA (see Figure 21).

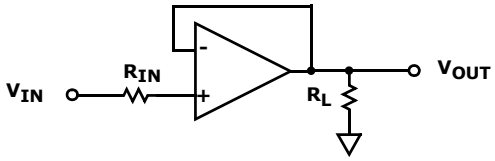

FIGURE 21. INPUT CURRENT LIMITING

Layout Guidelines for High Impedance Inputs

To achieve the maximum performance of the high input impedance and low offset voltage of the ISL28130, ISL28230 and ISL28430 amplifiers, care should be taken in the circuit board layout. The PC board surface must remain clean and free of moisture to avoid leakage currents between adjacent traces. Surface coating of the circuit board will reduce surface moisture and provide a humidity barrier, reducing parasitic resistance on the board.

High Gain, Precision DC-Coupled Amplifier

The circuit in Figure 22 implements a single-stage DC-coupled amplifier with an input DC sensitivity of under 100nV that is only possible using a low VOS amplifier with high open loop gain. High gain DC amplifiers operating from low voltage supplies are not practical using typical low offset precision op amps. For example, a typical precision amplifier in a gain of 10kV/V with a ±100µV V_{OS} and offset drift 0.5µV/°C of a low offset op amp would produce a DC error of >1V with an additional 5mV/°C of temperature dependent error making it difficult to resolve DC input voltage changes in the mV range.

The ±40µV max V_{OS} and 150nV/°C of temperature drift of the ISL28130, ISL28230, ISL28430 produces a temperature stable maximum DC output error of only ±400mV with a maximum output temperature drift of 1.5mV/°C. The additional benefit of a very low 1/f noise corner frequency and some feedback filtering enables DC voltages and voltage fluctuations well below 10µV to be easily detected with a simple single stage amplifier.
