PSoC® Programmable System-on-Chip™

Features

■ **Powerful Harvard Architecture Processor**
- ❒ M8C Processor Speeds to 24 MHz
- ❒ 8x8 Multiply, 32-Bit Accumulate
- ❒ Low Power at High Speed
- ❒ 3.0 to 5.25V Operating Voltage
- ❒ Industrial Temperature Range: -40°C to +85°C

■ **Advanced Peripherals (PSoC Blocks)**
- ❒ 4 Rail-to-Rail analog PSoC Blocks Provide:
  - Up to 14-Bit ADCs
  - Up to 8-Bit DACs
  - Programmable Gain Amplifiers
  - Programmable Filters and Comparators
- ❒ 4 Digital PSoC Blocks Provide:
  - 8 to 32-Bit Timers, Counters, and PWMs
  - CRC and PRS Modules
  - Full-Duplex UART
  - Multiple SPI™ Masters or Slaves
  - Connectable to All GPIO Pins
- ❒ Complex Peripherals by Combining Blocks
- ❒ High-Speed 8-Bit SAR ADC Optimized for Motor Control

■ **Precision, Programmable Clocking**
- ❒ Internal ±2.5% 24/48 MHz Oscillator
- ❒ High Accuracy 24 MHz with Optional 32 kHz Crystal and PLL
- ❒ Optional External Oscillator, up to 24 MHz
- ❒ Internal Oscillator for Watchdog and Sleep

■ **Flexible On-Chip Memory**
- ❒ 8K Bytes Flash Program Storage 50,000 Erase/Write Cycles
- ❒ 256 Bytes SRAM Data Storage
- ❒ In-System Serial Programming (ISSP)
- ❒ Partial Flash Updates
- ❒ Flexible Protection Modes
- ❒ EEPROM Emulation in Flash

■ **Programmable Pin Configurations**
- ❒ 25 mA Sink on all GPIO
- ❒ Pull up, Pull Down, High Z, Strong, or Open Drain Drive Modes on All GPIO
- ❒ Up to Ten Analog Inputs on GPIO
- ❒ Two 30 mA Analog Outputs on GPIO
- ❒ Configurable Interrupt on All GPIO

■ **Additional System Resources**
- ❒ I^2C™ Slave, Master, and Multi-Master to 400 kHz
- ❒ Watchdog and Sleep Timers
- ❒ User-Configurable Low Voltage Detection
- ❒ Integrated Supervisory Circuit
- ❒ On-chip Precision Voltage Reference

■ **Complete Development Tools**
- ❒ Free Development Software (PSoC Designer™)
- ❒ Full-Featured In-Circuit Emulator and Programmer
- ❒ Full Speed Emulation
- ❒ Complex Breakpoint Structure
- ❒ 128K Bytes Trace Memory

PSoC Functional Overview

The PSoC family consists of many mixed-signal array with On-Chip Controller devices. These devices are designed to replace multiple traditional MCU-based system components with a low cost single-chip programmable device. PSoC devices include configurable blocks of analog and digital logic, and programmable interconnects. This architecture allows the user to create customized peripheral configurations that match the requirements of each individual application. Additionally, a fast CPU, Flash program memory, SRAM data memory, and configurable IO are included in a range of convenient pinouts and packages.

The PSoC architecture, as shown in the Logic Block Diagram on page 1, consists of four main areas: PSoC Core, Digital System, Analog System, and System Resources. Configurable global busing allows combining all the device resources into a complete custom system. The PSoC CY8C23x33 family can have up to three IO ports that connect to the global digital and analog interconnects, providing access to four digital blocks and four analog blocks.

PSoC Core

The PSoC Core is a powerful engine that supports a rich feature set. The core includes a CPU, memory, clocks, and configurable GPIO (General Purpose IO).

The M8C CPU core is a powerful processor with speeds up to 24 MHz, providing a four MIPS 8-bit Harvard architecture microprocessor. The CPU uses an interrupt controller with 11 vectors, to simplify programming of real time embedded events. Program execution is timed and protected using the included Sleep and Watch Dog Timers (WDT).

Memory encompasses 8 KB of Flash for program storage, 256 bytes of SRAM for data storage, and up to 2 KB of EEPROM emulated using the Flash. Program Flash uses four protection levels on blocks of 64 bytes, allowing customized software IP protection.

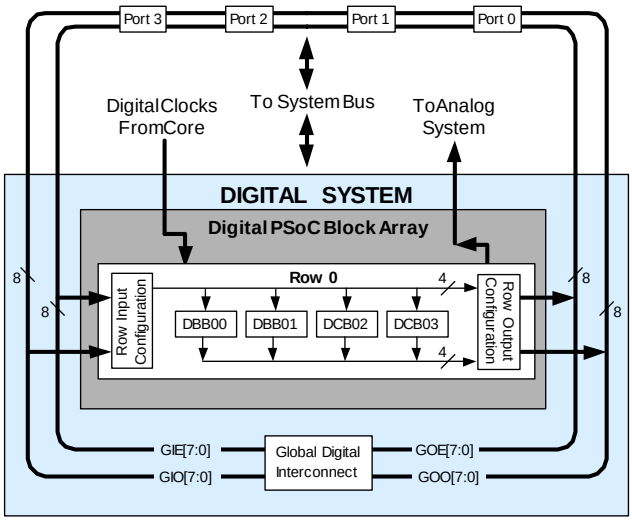
The PSoC device incorporates flexible internal clock generators, including a 24 MHz IMO (internal main oscillator) accurate to ±2.5% over temperature and voltage. The 24 MHz IMO can also be doubled to 48 MHz for use by the digital system. A low power 32 kHz ILO (internal low speed oscillator) is provided for the Sleep timer and WDT. If crystal accuracy is desired, the ECO (32.768 kHz external crystal oscillator) is available for use as a Real Time Clock (RTC) and can optionally generate a crystal-accurate 24 MHz system clock using a PLL. The clocks, together with programmable clock dividers (as a System Resource), provide the flexibility to integrate almost any timing requirement into the PSoC device.

PSoC GPIOs provide connection to the CPU, digital and analog resources of the device. Each pin's drive mode may be selected from eight options, allowing great flexibility in external interfacing. Every pin also has the capability to generate a system interrupt on high level, low level, and change from last read.

Digital System

The Digital System consists of 4 digital PSoC blocks. Each block is an 8-bit resource that is used alone or combined with other blocks to form 8, 16, 24, and 32-bit peripherals, which are called user module references.

Figure 1. Digital System Block Diagram



Digital peripheral configurations are:

- PWMs (8 to 32 bit)
- PWMs with Dead band (8 to 32 bit)
- Counters (8 to 32 bit)
- Timers (8 to 32 bit)
- UART 8 bit with selectable parity (up to 1)
- SPI master and slave (up to 1)
- I2C slave and master (1 available as a System Resource)
- Cyclical Redundancy Checker/Generator (8 to 32 bit)
- IrDA (up to 1)
- Pseudo Random Sequence Generators (8 to 32 bit)

The digital blocks can be connected to any GPIO through a series of global buses that can route any signal to any pin. The buses also allow for signal multiplexing and for performing logic operations. This configurability frees your designs from the constraints of a fixed peripheral controller.

Digital blocks are provided in rows of four, where the number of blocks varies by PSoC device family. This allows the optimum choice of system resources for your application. Family resources are shown in the table titled PSoC Device Characteristics on page 4.

Analog System

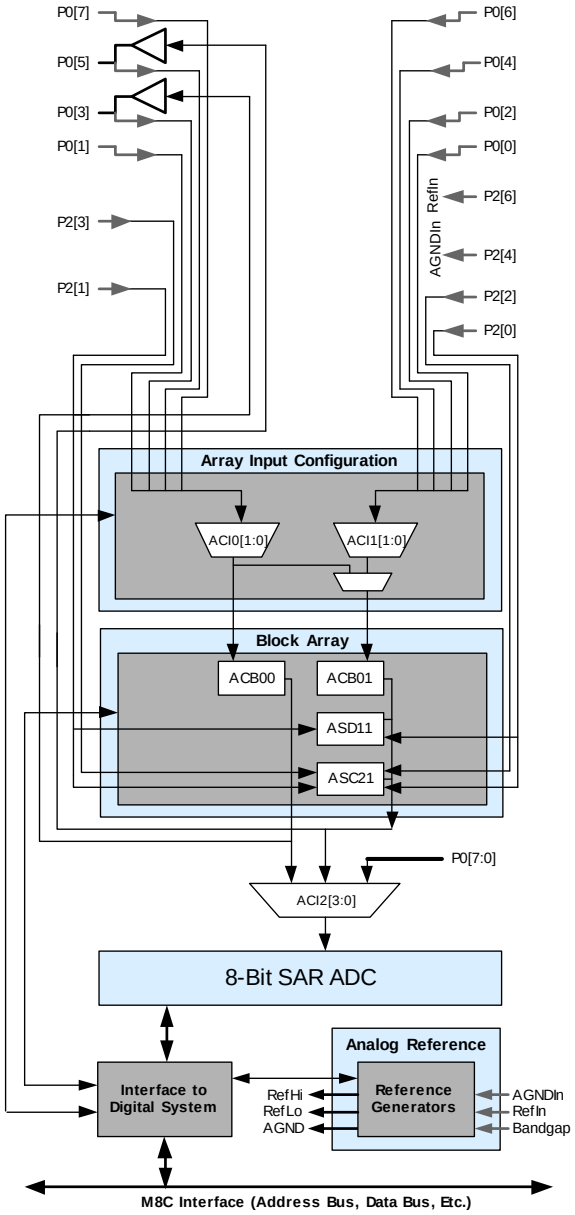
The Analog system consists of an 8-bit SAR ADC and four configurable blocks. The programmable 8-bit SAR ADC is an optimized ADC that runs up to 300 Ksps, with monotonic guarantee. It also has the features to support a motor control application.

Each analog block consists of an opamp circuit allowing the creation of complex analog signal flows. Analog peripherals are very flexible and can be customized to support specific application requirements. Some of the more common PSoC analog functions (most available as user modules) are:

- Filters (2 band pass, low-pass)
- Amplifiers (up to 2, with selectable gain to 48x)
- Instrumentation amplifiers (1 with selectable gain to 93x)
- Comparators (1, with 16 selectable thresholds)
- DAC (6 or 9 -bit DAC)
- Multiplying DAC (6 or 9 -bit DAC)
- High current output drivers (two with 30 mA drive)
- 1.3V reference (as a System Resource)
- DTMF dialer
- Modulators
- Correlators
- Peak detectors
- Many other topologies possible

Analog blocks are arranged in a column of three, which includes one CT (Continuous Time) and two SC (Switched Capacitor) blocks. The Analog Column 0 contains the SAR8 ADC block rather than the standard SC blocks.

Figure 2. Analog System Block Diagram



Additional System Resources

System Resources, some of which are listed in the previous sections, provide additional capability useful to complete systems. Additional resources include a multiplier, decimator, low voltage detection, and power on reset. Brief statements describing the merits of each system resource follow:

- Digital clock dividers provide three customizable clock frequencies for use in applications. The clocks can be routed to both the digital and analog systems. Additional clocks can be generated using digital PSoC blocks as clock dividers.
- A multiply accumulate (MAC) provides a fast 8-bit multiplier with 32-bit accumulate, to assist in both general math and digital filters.
- The decimator provides a custom hardware filter for digital signal processing applications including the creation of Delta Sigma ADCs.
- The I2C module provides 100 and 400 kHz communication over two wires. Slave, master, and multi-master modes are all supported.
- Low Voltage Detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.
- An internal 1.3V reference provides an absolute reference for the analog system, including ADCs and DACs.

PSoC Device Characteristics

Depending on the PSoC device characteristics, the digital and analog systems can have 16, 8, or 4 digital blocks and 12, 6, or 3 analog blocks. The following table lists the resources available for specific PSoC device groups.

Table 1. PSoC Device Characteristics

PSoC Part Number	Digital IO	Digital Rows	Digital Blocks	Analog Inputs	Analog Outputs	Analog Columns	Analog Blocks	SAR8 ADC
CY8C29x66	up to 64	4	16	12	4	4	12	No
CY8C27x43	up to 44	2	8	12	4	4	12	No

CY8C20x34	up to 28	0	0	28	0	0	3[3]	No

Notes
1. One complete column, plus one Continuous Time Block.
2. Limited analog functionality.
3. Two analog blocks and one CapSense.

Getting Started

The quickest path to understanding the PSoC silicon is by reading this data sheet and using the PSoC Designer Integrated Development Environment (IDE). This data sheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications. For in-depth information, along with detailed programming information, refer the PSoC Mixed-Signal Array Technical Reference Manual.

For latest Ordering, Packaging, and Electrical Specification information, refer the latest PSoC device data sheets on the web at http://www.cypress.com/psoc.

To determine which PSoC device meets your requirements, navigate through the PSoC Decision Tree in the Application Note AN2209 at http://www.cypress.com and select Application Notes under the Design Resources.

Development Kits

Development Kits are available from the following distributors: Digi-Key, Avnet, Arrow, and Future. The Cypress Online Store contains development kits, C compilers, and all accessories for PSoC development. Go to the Cypress Online Store web site at http://www.cypress.com/onlinestore.

Technical Training Modules

Free PSoC technical training modules are available for users new to PSoC. Training modules cover designing, debugging, advanced analog and CapSense. Go to http://www.cypress.com.

Consultants

Certified PSoC Consultants offer everything from technical assistance to completed PSoC designs. To contact or become a PSoC Consultant go to http://www.cypress.com, click on Design Support located at the top of the web page, and select CYPros Consultants.

Technical Support

PSoC application engineers take pride in fast and accurate response. They can be reached with a 4-hour guaranteed response at http://www.cypress.com/support.

Application Notes

A long list of application notes can assist you in every aspect of your design effort. To view the PSoC application notes, go to http://www.cypress.com/psocapnotes.

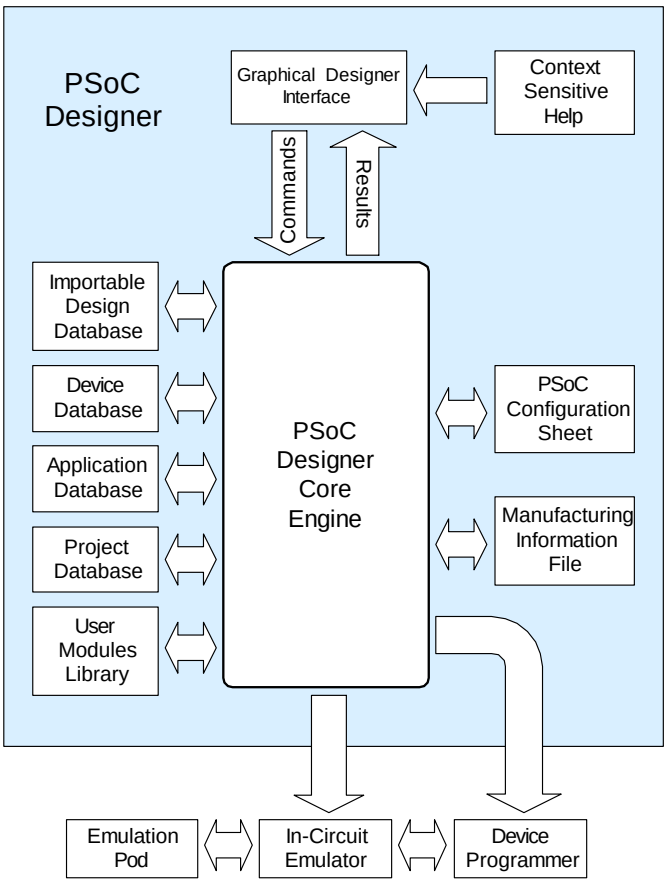
Development Tools

PSoC Designer is a Microsoft® Windows-based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE and application runs on Windows NT 4.0, Windows 2000, Windows Millennium (Me), or Windows XP (refer section PSoC Designer Subsystems on page 5).

PSoC Designer helps the customer to select an operating configuration for the PSoC, write application code that uses the PSoC, and debug the application. This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and the CYASM macro assembler for the CPUs.

PSoC Designer also supports a high-level C language compiler developed specifically for the devices in the family.

Figure 3. PSoC Designer Subsystems



PSoC Designer Software Subsystems

Device Editor

The Device Editor subsystem allows the user to select different onboard analog and digital components called user modules using the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters.

The device editor also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic configuration allows for changing configurations at run time.

PSoC Designer sets up power on initialization tables for selected PSoC block configurations and creates source code for an application framework. The framework contains software to operate the selected components and, if the project uses more than one operating configuration, contains routines to switch between different sets of PSoC block configurations at run time. PSoC Designer can print out a configuration sheet for a given project configuration for use during application programming in conjunction with the Device Data Sheet. Once the framework is generated, the user can add application-specific code to flesh out the framework. It is also possible to change the selected components and regenerate the framework.

Design Browser

The Design Browser allows users to select and import preconfigured designs into the user's project. Users can easily browse a catalog of preconfigured designs to facilitate time-to-design. Examples provided in the tools include a 300-baud modem, LIN Bus master and slave, fan controller, and magnetic card reader.

Application Editor

In the Application Editor you can edit your C language and Assembly language source code. You can also assemble, compile, link, and build.

Assembler. The macro assembler allows the assembly code to be merged seamlessly with C code. The link libraries automatically use absolute addressing or can be compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compiler. A C language compiler is available that supports the PSoC family of devices. Even if you have never worked in the C language before, the product quickly allows you to create complete C programs for the PSoC family devices.

The embedded, optimizing C compiler provides all the features of C tailored to the PSoC architecture. It comes complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

The PSoC Designer Debugger subsystem provides hardware in-circuit emulation, allowing the designer to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read and program and read and write data memory, read and write IO registers, read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help for the user. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

Hardware Tools

In-Circuit Emulator

A low cost, high functionality ICE (In-Circuit Emulator) is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal and can operate with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full speed (24 MHz) operation.

Designing with User Modules

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called PSoC Blocks, have the ability to implement a wide variety of user-selectable functions. Each block has several registers that determine its function and connectivity to other blocks, multiplexers, buses and to the IO pins. Iterative development cycles permit you to adapt the hardware and the software. This substantially lowers the risk of having to select a different part to meet the final design requirements.

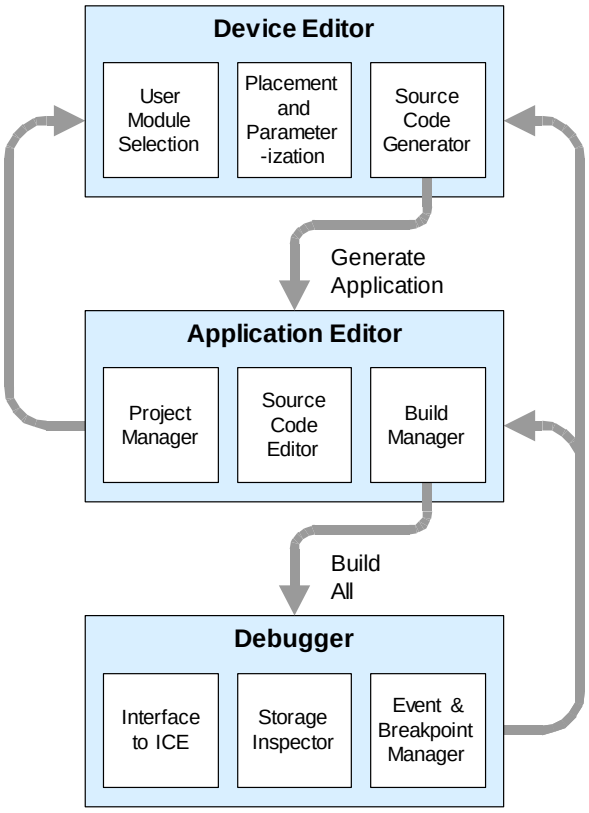
To speed the development process, the PSoC Designer Integrated Development Environment (IDE) provides a library of pre-built, pre-tested hardware peripheral functions, called “User Modules.” User modules make selecting and implementing peripheral devices simple, and come in analog, digital, and mixed signal varieties. The standard User Module library contains over 50 common peripherals such as ADCs, DACs Timers, Counters, UARTs, and other uncommon peripherals such as DTMF Generators and Bi-Quad analog filter sections.

Each user module establishes the basic register settings that implement the selected function. It also provides parameters that allow you to tailor its precise configuration to your particular application. For example, a Pulse Width Modulator User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit you to establish the pulse width and duty cycle. User modules also provide tested software to cut your development time. The user module application programming interface (API) provides high level functions to control and respond to hardware events at run-time. The API also provides optional interrupt service routines that you can adapt as needed.

The API functions are documented in user module data sheets that are viewed directly in the PSoC Designer IDE. These data sheets explain the internal operation of the user module and provide performance specifications. Each data sheet describes the use of each user module parameter and documents the setting of each register controlled by the user module.

The development process starts when you open a new project and bring up the Device Editor, a graphical user interface (GUI) for configuring the hardware. You pick the user modules you need for your project and map them onto the PSoC blocks with point-and-click simplicity. Next, you build signal chains by interconnecting user modules to each other and the IO pins. At this stage, you also configure the clock source connections and enter parameter values directly or by selecting values from drop-down menus. When you are ready to test the hardware configuration or move on to developing code for the project, you perform the “Generate Application” step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the high-level user module API functions.

Figure 4. User Module/Source Code Development Flows



The next step is to write your main program, and any sub-routines using PSoC Designer's Application Editor subsystem. The Application Editor includes a Project Manager that allows you to open the project source code files (including all generated code files) from a hierarchal view. The source code editor provides syntax coloring and advanced edit features for both C and assembly language. File search capabilities include simple string searches and recursive "grep-style" patterns. A single mouse click invokes the Build Manager. It employs a professional-strength "makefile" system to automatically analyze all file dependencies and run the compiler and assembler as necessary. Project-level options control optimization strategies used by the compiler and linker. Syntax errors are displayed in a console window. Double clicking the error message takes you directly to the offending line of source code. When all is correct, the linker builds a HEX file image suitable for programming.

The last step in the development process takes place inside the PSoC Designer's Debugger subsystem. The Debugger downloads the HEX image to the In-Circuit Emulator (ICE) where it runs at full speed. Debugger capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the Debugger provides a large trace buffer and allows you define complex breakpoint events that include monitoring address and data bus values, memory locations and external signals.

Units of Measure

A units of measure table is located in the section Electrical Specifications on page 14. Table 8 on page 14 lists all the abbreviations used to measure the PSoC devices.

Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, 01010100b' or '01000011b'). Numbers not indicated by an 'h' or 'b' are decimal.

Pinouts

The PSoC CY8C23X33 is available in 32-pin QFN and 28-pin SSOP packages. Every port pin (labeled with a “P”), except for Vss and Vdd in the following table and figure, is capable of Digital IO.

Register Reference

This section lists the registers of the CY8C23433 PSoC device by using mapping tables, in offset order.

Register Conventions

Abbreviations Used

The register conventions specific to this section are listed in the following table.

Table 5. Abbreviations

Convention	Description
R	Read register or bits
W	Write register or bits
L	Logical register or bits
C	Clearable register or bits
#	Access is bit specific

Register Mapping Tables

The PSoC device has a total register address space of 512 bytes. The register space is referred to as IO space and is divided into two banks. The XOI bit in the Flag register (CPU_F) determines which bank the user is currently in. When the XOI bit is set the user is in Bank 1.

Note In the following register mapping tables, blank fields are reserved and must not be accessed.

Electrical Specifications

This section presents the DC and AC electrical specifications of the CY8C23433 PSoC device. For the latest electrical specifications, visit http://www.cypress.com/psoc. Specifications are valid for -40°C ≤ T_A ≤ 85°C and T_J ≤ 100°C, except where noted. Refer to Table 24 on page 25 for the electrical specifications on the internal main oscillator (IMO) using SLIMO mode.

Absolute Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Table 9. Absolute Maximum Ratings

Symbol	Description	Min	Typ	Max	Units	Notes
T_{STG}	Storage Temperature	-55	25	+100	°C	Higher storage temperatures reduce data retention time. Recommended storage temperature is +25°C ± 25°C. Extended duration storage temperatures above 65°C degrade reliability.
T_A	Ambient Temperature with Power Applied	-40	–	+85	°C	
Vdd	Supply Voltage on Vdd Relative to Vss	-0.5	–	+6.0	V	
V_{IO}	DC Input Voltage	Vss - 0.5	–	Vdd + 0.5	V	
V_{IOZ}	DC Voltage Applied to Tri-state	Vss - 0.5	–	Vdd + 0.5	V	
I_{MIO}	Maximum Current into any Port Pin	-25	–	+50	mA	
ESD	Electro Static Discharge Voltage	2000	–	–	V	Human Body Model ESD.
LU	Latch-up Current	–	–	200	mA	

Operating Temperature

Table 10. Operating Temperature

Symbol	Description	Min	Typ	Max	Units	Notes
T_A	Ambient Temperature	-40	–	+85	°C	
T_J	Junction Temperature	-40	–	+100	°C	The temperature rise from ambient to junction is package specific. See Thermal Impedances by Package on page 35. The user must limit the power consumption to comply with this requirement.

DC Electrical Characteristics

DC Chip-Level Specifications

The following table lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and -40°C ≤ T_A ≤ 85°C, or 3.0V to 3.6V and -40°C ≤ T_A ≤ 85°C, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Table 11. DC Chip-Level Specifications

Symbol	Description	Min	Typ	Max	Units	Notes
Vdd	Supply Voltage	3.0	–	5.25	V	See DC POR and LVD Specifications on page 22.
I_{DD}	Supply Current	–	5	8	mA	Conditions are Vdd = 5.0V, T_A = 25°C, CPU = 3 MHz, SYSCLK doubler disabled, VC1 = 1.5 MHz, VC2 = 93.75 kHz, VC3 = 93.75 kHz, analog power = off. SLIMO mode = 0. IMO = 24 MHz.
I_{DD3}	Supply Current	–	3.3	6.0	mA	Conditions are Vdd = 3.3V, T_A = 25°C, CPU = 3 MHz, SYSCLK doubler disabled, VC1 = 1.5 MHz, VC2 = 93.75 kHz, VC3 = 93.75 kHz, analog power = off. SLIMO mode = 0. IMO = 24 MHz.
I_{SB}	Sleep (Mode) Current with POR, LVD, Sleep Timer, and WDT.[8]	–	3	6.5	µA	Conditions are with internal slow speed oscillator, Vdd = 3.3V, -40°C ≤ T_A ≤ 55°C, analog power = off.
I_{SBH}	Sleep (Mode) Current with POR, LVD, Sleep Timer, and WDT at high temperature.[8]	–	4	25	µA	Conditions are with internal slow speed oscillator, Vdd = 3.3V, 55°C < T_A ≤ 85°C, analog power = off.
I_{SBXTL}	Sleep (Mode) Current with POR, LVD, Sleep Timer, WDT, and external crystal.[8]	–	4	7.5	µA	Conditions are with properly loaded, 1 µW max, 32.768 kHz crystal. Vdd = 3.3V, -40°C ≤ T_A ≤ 55°C, analog power = off.
I_{SBXTLH}	Sleep (Mode) Current with POR, LVD, Sleep Timer, WDT, and external crystal at high temperature.[8]	–	5	26	µA	Conditions are with properly loaded, 1µW max, 32.768 kHz crystal. Vdd = 3.3 V, 55°C < T_A ≤ 85°C, analog power = off.
V_{REF}	Reference Voltage (Bandgap)	1.28	1.30	1.33	V	Trimmed for appropriate Vdd. Vdd > 3.0V

Note
8. Standby current includes all functions (POR, LVD, WDT, Sleep Time) needed for reliable system operation. This must be compared with devices that have similar functions enabled.

DC General Purpose IO Specifications

The following table lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and -40°C ≤ T_A ≤ 85°C, or 3.0V to 3.6V and -40°C ≤ T_A ≤ 85°C, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

DC Analog Reference Specifications

The following table lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and -40°C ≤ T_A ≤ 85°C, or 3.0V to 3.6V and -40°C ≤ T_A ≤ 85°C, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

The guaranteed specifications are measured through the Analog Continuous Time PSoC blocks. The power levels for AGND refer to the power of the Analog Continuous Time PSoC block. The power levels for RefHi and RefLo refer to the Analog Reference Control register. The limits stated for AGND include the offset error of the AGND buffer local to the Analog Continuous Time PSoC block. Reference control power is high.

V_{OHV}	Output High Voltage During Programming or Verify	Vdd - 1.0	–	Vdd	V	
$Flash_{ENPB}$	Flash Endurance (per block)	50,000	–	–	–	Erase/write cycles per block
$Flash_{ENT}$	Flash Endurance (total)[11]	1,800,000	–	–	–	Erase/write cycles
$Flash_{DR}$	Flash Data Retention	10	–	–	Years	

Note

11. A maximum of 36 x 50,000 block endurance cycles is allowed. This may be balanced between operations on 36x1 blocks of 50,000 maximum cycles each, 36x2 blocks of 25,000 maximum cycles each, or 36x4 blocks of 12,500 maximum cycles each (to limit the total number of cycles to 36x50,000 and that no single block ever sees more than 50,000 cycles).
For the full industrial range, the user must employ a temperature sensor user module (FlashTemp) and feed the result to the temperature argument before writing. Refer to 0xthe Flash APIs Application Note AN2015 at http://www.cypress.com under Application Notes for more information.

SAR8 ADC DC Specifications

The following table lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and -40°C ≤ T_A ≤ 85°C, or 3.0V to 3.6V and -40°C ≤ T_A ≤ 85°C, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Symbol	Description	Min	Typ	Max	Units	Notes
$V_{ADCVREF}$	Reference voltage at pin P3[0] when configured as ADC reference voltage	3.0	–	5.25	V	The voltage level at P3[0] (when configured as ADC reference voltage) must always be maintained to be less than chip supply voltage level on Vdd pin. $V_{ADCVREF}$ < Vdd.
$I_{ADCVREF}$	Current when P3[0] is configured as ADC V_{REF}	3	–	–	mA	
INL	Integral Non-linearity	-1.5	–	+1.5	LSB	
INL (limited range)	Integral Non-linearity accommodating a shift in the offset at 0x80	-1.2[12]	–	+1.2	LSB	The maximum LSB is over a sub-range not exceeding 1/16 of the full-scale range. 0x7F and 0x80 points specs are excluded here
DNL	Differential Non-linearity	-2.3	–	+2.3	LSB	ADC conversion is monotonic over full range
DNL (limited range)	Differential Non-linearity excluding 0x7F-0x80 transition	-1	–	+1	LSB	ADC conversion is monotonic over full range. 0x7F to 0x80 transition specs are excluded here.

Notes

12. SAR converters require a stable input voltage during the sampling period. If the voltage into the SAR8 changes by more than 1 LSB during the sampling period then the accuracy specifications may not be met

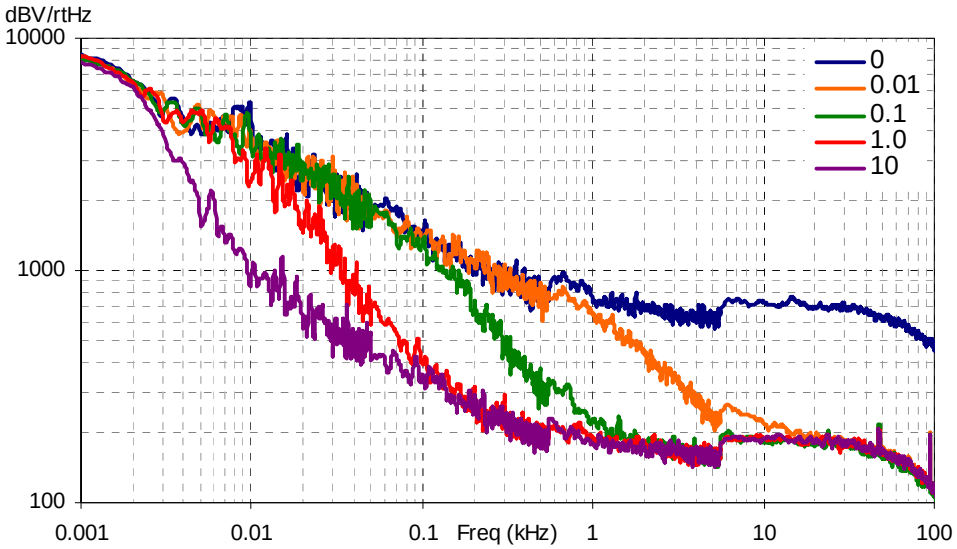
When bypassed by a capacitor on P2[4], the noise of the analog ground signal distributed to each block is reduced by a factor of up to 5 (14 dB). This is at frequencies above the corner frequency defined by the on-chip 8.1k resistance and the external capacitor.

Figure 15. Typical AGND Noise with P2[4] Bypass



At low frequencies, the opamp noise is proportional to 1/f, power independent, and determined by device geometry. At high frequencies, increased power level reduces the noise spectrum level.

AC External Clock Specifications

The following table lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and -40°C ≤ T_A ≤ 85°C, or 3.0V to 3.6V and -40°C ≤ T_A ≤ 85°C, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Table 32. 5V AC External Clock Specifications

Symbol	Description	Min	Typ	Max	Units
F_{OSCEXT}	Frequency	0.093	–	24.6	MHz
–	High Period	20.6	–	5300	ns
–	Low Period	20.6	–	–	ns
–	Power Up IMO to Switch	150	–	–	µs

Table 33. 3.3V AC External Clock Specifications

Symbol	Description	Min	Typ	Max	Units
F_{OSCEXT}	Frequency with CPU Clock divide by 1[18]	0.093	–	12.3	MHz
F_{OSCEXT}	Frequency with CPU Clock divide by 2 or greater[19]	0.186	–	24.6	MHz
–	High Period with CPU Clock divide by 1	41.7	–	5300	ns
–	Low Period with CPU Clock divide by 1	41.7	–	–	ns
–	Power Up IMO to Switch	150	–	–	µs

AC Programming Specifications

The following table lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and -40°C ≤ T_A ≤ 85°C, or 3.0V to 3.6V and -40°C ≤ T_A ≤ 85°C, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Table 34. AC Programming Specifications

Symbol	Description	Min	Typ	Max	Units	Notes
T_{RSCLK}	Rise Time of SCLK	1	–	20	ns	
T_{FSCLK}	Fall Time of SCLK	1	–	20	ns	
T_{SSCLK}	Data Set up Time to Falling Edge of SCLK	40	–	–	ns	
T_{HSCLK}	Data Hold Time from Falling Edge of SCLK	40	–	–	ns	
F_{SCLK}	Frequency of SCLK	0	–	8	MHz	
T_{ERASEB}	Flash Erase Time (Block)	–	20	–	ms	
T_{WRITE}	Flash Block Write Time	–	20	–	ms	
T_{DSCLK}	Data Out Delay from Falling Edge of SCLK	–	–	45	ns	Vdd > 3.6
T_{DSCLK3}	Data Out Delay from Falling Edge of SCLK	–	–	50	ns	3.0 ≤ Vdd ≤ 3.6

SAR8 ADC AC Specifications

The following table lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and -40°C ≤ T_A ≤ 85°C, or 3.0V to 3.6V and -40°C ≤ T_A ≤ 85°C, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Table 35. SAR8 ADC AC Specifications[20]

Symbol	Description	Min	Typ	Max	Units
$Freq_3$	Input clock frequency 3V	–	–	3.075	MHz
$Freq_5$	Input clock frequency 5V	–	–	3.075	MHz

Notes
18. Maximum CPU frequency is 12 MHz at 3.3V. With the CPU clock divider set to 1, the external clock must adhere to the maximum frequency and duty cycle requirements.
19. If the frequency of the external clock is greater than 12 MHz, the CPU clock divider must be set to 2 or greater. In this case, the CPU clock divider ensures that the fifty percent duty cycle requirement is met.
20. The max sample rate in this R2R ADC is 3.0/8=375KSPS

AC I²C Specifications

The following table lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and -40°C ≤ T_A ≤ 85°C, or 3.0V to 3.6V and -40°C ≤ T_A ≤ 85°C, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Table 36. AC Characteristics of the I²C SDA and SCL Pins for Vdd > 3.0V

Symbol	Description	Standard Mode		Fast Mode		Units
		Min	Max	Min	Max	
F_{SCLI2C}	SCL Clock Frequency	0	100	0	400	kHz
$T_{HDSTAI2C}$	Hold Time (repeated) START Condition. After this period, the first clock pulse is generated.	4.0	–	0.6	–	µs
T_{LOWI2C}	LOW Period of the SCL Clock	4.7	–	1.3	–	µs
$T_{HIGHI2C}$	HIGH Period of the SCL Clock	4.0	–	0.6	–	µs

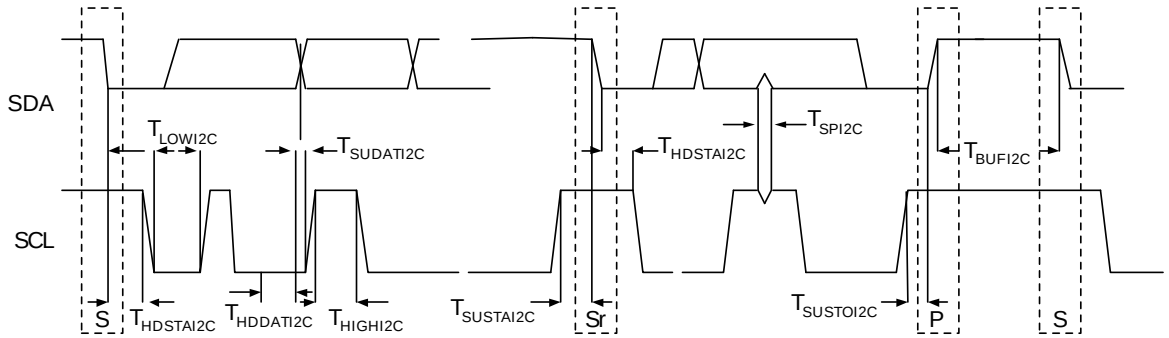
Figure 17. Definition for Timing for Fast/Standard Mode on the I²C Bus



Note

21. A Fast-Mode I2C-bus device can be used in a Standard-Mode I2C-bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{rmax} + t_{SU;DAT} = 1000 + 250 = 1250$ ns (according to the Standard-Mode I2C-bus specification) before the SCL line is released.

Packaging Information

This section illustrates the packaging specifications for the CY8C23x33 PSoC device, along with the thermal impedances for each package, solder reflow peak temperature, and the typical package capacitance on crystal pins.

Package	Typical θ_{JA} [22]
32 QFN	19.4°C/W
28 SSOP	95°C/W

Capacitance on Crystal Pins

Table 39. Typical Package Capacitance on Crystal Pins

Package	Package Capacitance
32 QFN	2.0 pF
28 SSOP	2.8 pF

Solder Reflow Peak Temperature

Following is the minimum solder reflow peak temperature to achieve good solderability.

Table 40. Solder Reflow Peak Temperature

Package	Minimum Peak Temperature [23]	Maximum Peak Temperature
32 QFN	240°C	260°C
28 SSOP	240°C	260°C

Notes
22. $T_J = T_A + POWER \times \theta_{JA}$.
23. Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are 220 ± 5°C with Sn-Pb or 245 ± 5°C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.
