Description

The Hitachi HN58C256 is a electrically erasable and programmable ROM organized as 32768-word × 8-bit. It realizes high speed, low power consumption, and a high level of reliability, employing advanced MNOS memory technology and CMOS process and circuitry technology. It also has a 64-byte page programming function to make its erase and write operations faster.

Features

- Single 5 V supply
- On-chip latches: address, data, $\overline{CE}$, $\overline{OE}$, $\overline{WE}$
- Automatic byte write: 10 ms max
- Automatic page write (64 bytes): 10 ms max
- Fast access time: 200 ns max
- Low power dissipation: 20 mW/MHz typ (active)
  1.1 mW max (standby)
- $\overline{Data}$ polling
- Data protection circuit on power on/off
- Conforms to JEDEC byte-wide standard
- Reliable CMOS with MNOS cell technology
- 10^5 erase/write cycles (in page mode)
- 10 year data retention

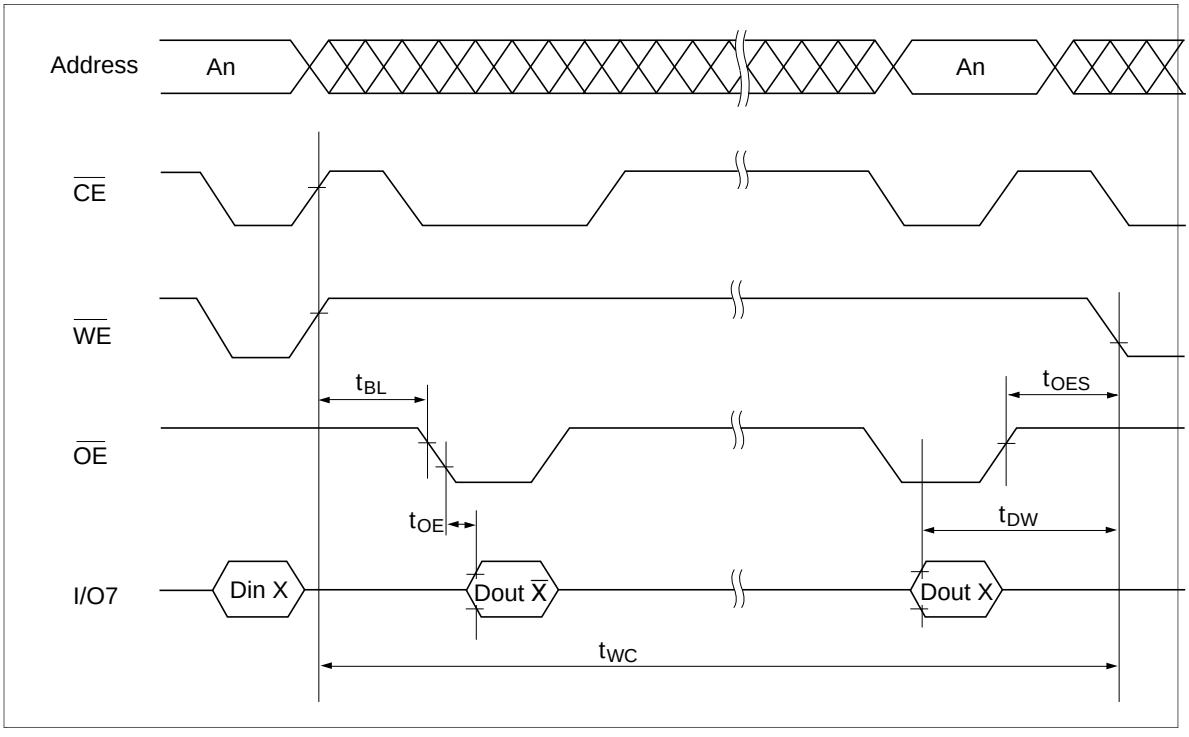
$\overline{\text{Data}}$ Polling Timing Waveform



Functional Description

Automatic Page Write

Page-mode write feature allows 1 to 64 bytes of data to be written into the EEPROM in a single write cycle. Following the initial byte cycle, an additional 1 to 63 bytes can be written in the same manner. Each additional byte load cycle must be started within 30 µs of the preceding rising edge of $\overline{\text{WE}}$. When $\overline{\text{CE}}$ or $\overline{\text{WE}}$ is high for 100 µs after data input, the EEPROM enters write mode automatically and the input data are written into the EEPROM.

$\overline{\text{Data}}$ Polling

$\overline{\text{Data}}$ polling allows the status of the EEPROM to be determined. If EEPROM is set to read mode during a write cycle, an inversion of the last byte of data to be loaded outputs from I/O7 to indicate that the EEPROM is performing a write operation.

$\overline{\text{WE}}$, $\overline{\text{CE}}$ Pin Operation

During a write cycle, addresses are latched by the falling edge of $\overline{\text{WE}}$ or $\overline{\text{CE}}$, and data is latched by the rising edge of $\overline{\text{WE}}$ or CE.

Write/Erase Endurance and Data Retention Time

The endurance is 10^5 cycles in case of the page programming and 10^4 cycles in case of byte programming (1% cumulative failure rate). The data retention time is more than 10 years when a device is page-

programmed less than 10^4 cycles.

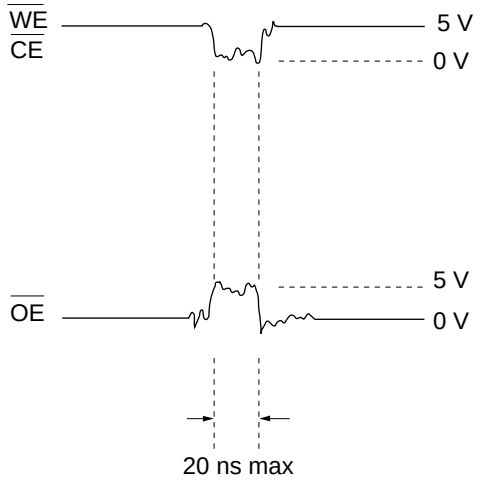
Data Protection

1. Data Protection against Noise on Control Pins ($\overline{CE}$, $\overline{OE}$, $\overline{WE}$) during Operation

During readout or standby, noise on the control pins may act as a trigger and turn the EEPROM to program mode by mistake.

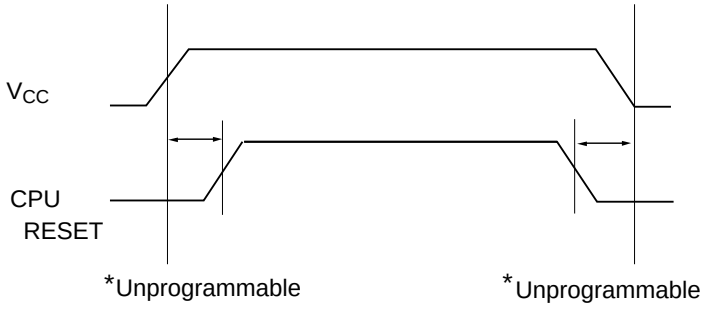
To prevent this phenomenon, this device has a noise cancelation function that cuts noise if its width is 20 ns or less in program mode.

Be careful not to allow noise of a width of more than 20 ns on the control pins.



2. Data Protection at V_{CC} On/Off

When V_{CC} is turned on or off, noise on the control pins generated by external circuits (CPU, etc) may act as a trigger and turn the EEPROM to program mode by mistake. To prevent this unintentional programming, the EEPROM must be kept in an unprogrammable state while the CPU is in an unstable state.



* The EEPROM should be kept in unprogrammable state during V_{CC} on/off by using CPU RESET signal.

In addition, when V_{CC} is turned on or off, the input level of control pins must be held as shown in the table below.

$\overline{CE}$	V_{CC}	X	X
$\overline{OE}$	X	V_{SS}	X
$\overline{WE}$	X	X	V_{CC}

X: Don't care.
V_{CC}: Pull-up to V_{CC} level.
V_{SS}: Pull-down to V_{SS} level.
