

64-BIT RANDOM ACCESS MEMORY

(With Open-Collector Outputs)

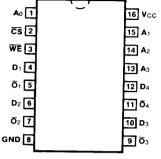

DESCRIPTION — The '89 a high speed, low power 64-bit Random Access Memory organized as a 16-word by 4-bit array. Address inputs are buffered to minimize loading, and addresses are fully decoded on-chip. Outputs are open-collector type and are in the off (HIGH) state when both the Chip Select (CS) and Write Enable (WE) are HIGH. For all other combinations of CS and WE the outputs are active, presenting the complement of either the stored data (READ mode) or the information present on the D inputs.

- OPEN-COLLECTOR OUTPUTS FOR WIRED-AND APPLICATIONS
- BUFFERED INPUTS MINIMIZE LOADING
- ADDRESS DECODING ON-CHIP
- DIODE CLAMPED INPUTS MINIMIZE RINGING

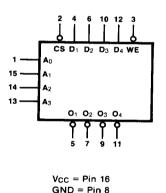

ORDERING CODE: See Section 9
