

1Gbps to 4.25Gbps Multirate Transimpedance Amplifier with Photocurrent Monitor

General Description

The MAX3793 transimpedance amplifier provides a compact low-power solution for applications from 1Gbps up to 4.25Gbps.

The MAX3793 features 195nA input-referred noise, 3.5k Ω transimpedance gain, 2.9GHz bandwidth ($C_{IN} = 0.3pF$) and 2.8mA $_P$ -P input overload. Operating from a +3.3V supply, the MAX3793 consumes only 106mW. An integrated filter resistor provides positive bias for the photodiode. These features, combined with a small die size, allow easy assembly into a TO-46 header with a photodiode. The MAX3793 also includes an average photocurrent monitor.

The MAX3793 has a typical optical sensitivity of -20dBm (0.55A/W) at 4.25Gbps. Typical optical overload is at 4dBm. The MAX3793 and the MAX3794 limiting amplifiers provide a complete solution for multirate receiver applications.

Features

- ◆ 4.7psp-p Deterministic Jitter (DJ)
- ◆ 195nA $_{RMS}$ Input-Referred Noise
- ◆ 2.9GHz Small-Signal Bandwidth
- ◆ 2.8mA $_P$ -P AC Overload
- ◆ Photocurrent Output Monitor
- ◆ 3.5k Ω Differential Gain
- ◆ Compact Die Size (30 mils x 50 mils)

Applications

SFF/SFP Transceiver Modules from 1Gbps to 4.25Gbps
 Gigabit Ethernet Optical Receivers
 Multirate Fibre-Channel Optical Receivers

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX3793E/D	-40°C to +85°C	Dice*

*Dice are designed to operate from -40°C to +85°C ambient temperature, but are tested and guaranteed only at $T_A = +25^\circ\text{C}$.

Typical Application Circuit

1 Gbps to 4.25 Gbps Multirate Transimpedance Amplifier with Photocurrent Monitor

ABSOLUTE MAXIMUM RATINGS

Power-Supply Voltage (V_{CC}).....	-0.5V to +4.5V	Continuous Input Current (FILTER).....	-8mA to +8mA
Continuous CML Output Current (OUT+, OUT-)	-25mA to +25mA	Operating Junction Temperature Range (T_J)	-55°C to +150°C
Continuous Input Current (IN).....	-4mA to +4mA	Storage Ambient Temperature Range (T_{STG})	-55°C to +150°C
		Die Attach Temperature.....	+400°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($V_{CC} = +2.97V$ to $+3.63V$, $T_A = -40^\circ C$ to $+85^\circ C$. Typical values are at $V_{CC} = +3.3V$, source capacitance $C_{IN} = 0.60pF$, $T_A = +25^\circ C$, unless otherwise noted.) (Notes 1, 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Power-Supply Current	I_{CC}	Measured with AC-coupled output		32	46	mA
Input Bias Voltage					1.0	V
Input Overload	I_{OL}	(Note 3)	2.2	2.8		mAp-p

ELECTRICAL CHARACTERISTICS (continued)

(V_{CC} = +2.97V to +3.63V, T_A = -40°C to +85°C. Typical values are at V_{CC} = +3.3V, source capacitance C_{IN} = 0.60pF, T_A = +25°C, unless otherwise noted.) (Notes 1, 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Differential Output Return Loss		Frequency ≤ 1GHz		18		dB
		1GHz < frequency ≤ 4GHz		9		
Single-Ended Output Return Loss		Frequency ≤ 1GHz		14		dB
		1GHz < frequency ≤ 4GHz		11		
Power-Supply Noise Rejection (Note 7)	PSNR	I _{IN} = 0, f < 1MHz		47		dB
		I _{IN} = 0, 1MHz ≤ f < 10MHz		22		
Minimum Photocurrent to be Detected	I _{AVGMIN}				2	μA
Maximum Photocurrent to be Detected	I _{AVGMAX}		1			mA
Maximum Photocurrent Monitor Output Offset	I _{MON} (OFFSET)	I _{IN} = 0μA _{P-P}			10	μA
Photocurrent Monitor Output Offset Temperature Dependency	ΔI _{MON} (OFFSET)	I _{IN} = 0μA _{P-P} ΔI _{MON} (OFFSET) = ABS (I _{MON} (OFFSET) (-40°C) - I _{MON} (OFFSET) (+100°C))		0.21		μA
Monitor Output Compliance Voltage	V _{MON}		0		2	V
Photocurrent Monitor Gain	A _{MON}	2μA ≤ I _{AVG} ≤ 1.0mA		1		A/A
Photocurrent Monitor Gain Stability		2μA ≤ I _{AVG} ≤ 1.0mA (Notes 3, 8)	-10		+10	%
Photocurrent Monitor Gain Bandwidth		2μA ≤ I _{AVG} ≤ 1.0mA		7		MHz

Note 1: Die parameters are production tested at room temperature only, but are guaranteed by design and characterization from -40°C to +85°C.

Note 2: Source capacitance represents the total external capacitance at the IN pad during characterization of the noise and bandwidth parameters.

Note 3: Guaranteed by design and characterization.

Note 4: Input-referred noise is:

$$\left(\frac{\text{RMS Output Noise}}{\text{Gain at } f = 100\text{MHz}} \right)$$

Note 5: Values are derived by calculation from the C_{IN} = 0.6pF measurements.

Note 6: DJ is the sum of pulse-width distortion (PWD) and pattern-dependent jitter (PDJ). DJ is measured using a 3.2GHz 4th-order Bessel filter on the input.

Note 7: Power-supply noise rejection PSNR = -20log(ΔV_{OUT} / ΔV_{CC}), where ΔV_{OUT} is the change in differential output voltage and ΔV_{CC} is the noise on V_{CC}.

Note 8: Gain stability is defined as

$$(A_{\text{MON}} - A_{\text{MON-NOM}}) / (A_{\text{MON-NOM}})$$

over the listed current range, temperature, and supply variation. Nominal gain is measured at V_{CC} = +3.3V and +25°C.

Pin Description

BOND PAD	NAME	FUNCTION
1	OUT+	Noninverting Data Output. Current flowing into IN causes the voltage at OUT+ to increase.
2, 3	VCC	+3.3V Supply Voltage. The pads are not internally connected. Therefore, they must always be externally bonded.
4	FILT	Provides bias voltage for the photodiode through a 750Ω resistor to VCC. When grounded, this pin disables the DC-cancellation amplifier to allow a DC path from IN to OUT+ and OUT- for testing.
5	IN	TIA Input. Signal current from photodiode flows into this pin.
6	MON	Photocurrent Monitor. Output current from MON is proportional to the average current in R _{FILT} . Connect a resistor between MON and ground to monitor the average photocurrent.
7, 11	GND	Circuit Ground. The pads are not internally connected. Therefore, they must always be externally bonded.
8, 10	N.C.	No Connection
9	OUT-	Inverting Data Output. Current flowing into IN causes the voltage at OUT- to decrease.

See the Wire Bonding section for recommended bonding sequence, Figure 4.

MAX3793

Figure 1. MAX3793 Limited Output

Figure 2. DC-Cancellation Effect on Input

Detailed Description

The MAX3793 transimpedance amplifier is designed for 1Gbps to 4.25Gbps fiber optic applications. The MAX3793 is comprised of a transimpedance amplifier, a voltage amplifier, an output buffer, a DC-cancellation circuit, a photodiode biasing resistor, and a photocurrent monitor (see the *Functional Diagram*).

Transimpedance Amplifier

The signal current at the input flows into the summing node of a high-gain amplifier. Shunt feedback through resistor R_F converts this current into a voltage. Schottky diodes clamp the output signal for large input currents (Figure 1).

Voltage Amplifier

The voltage amplifier provides additional gain and converts the transimpedance amplifier single-ended output signal into a differential signal.

Output Buffer

The output buffer is designed to drive a 100Ω differential load between $OUT+$ and $OUT-$. For optimum supply noise rejection, the MAX3793 should be terminated with a matched load. The MAX3793 outputs do not drive a DC-coupled grounded load. The outputs should always be AC-coupled. Refer to Application Note HFAN-1.1: *Choosing AC-Coupling Capacitors* for a more detailed discussion on selecting capacitors. If a single-ended output is required, both the used and the unused outputs should be terminated in a similar manner. See Figure 6.

DC-Cancellation Circuit

The DC-cancellation circuit uses low-frequency feedback to remove the DC component of the input signal (Figure 2). This feature centers the input signal within the transimpedance amplifier's linear range, thereby reducing pulse-width distortion.

The DC-cancellation circuit is internally compensated and does not require external capacitors. This circuit minimizes pulse-width distortion for data sequences that exhibit a 50% mark density. A mark density significantly different from 50% causes the MAX3793 to generate pulse-width distortion. Grounding the $FILT$ pin disables the DC-cancellation circuit. For normal operation, the DC-cancellation circuit must be enabled.

Photocurrent Monitor

The MAX3793 includes an average photocurrent monitor. The current sourced from MON to ground is proportionally equal to the average R_{FILT} current (see the *Typical Operating Characteristics*). This R_{FILT} is used to bias the photodiode, see Figure 7.

R_{FILT} is an internal 750Ω resistor between V_{CC} and $FILT$. This resistor is to be used in conjunction with an external C_{FILT} to bias the photodiode. The current through this resistor is monitored and creates the photocurrent monitor output. For test purposes, driving $FILT$ below 0.5V disables the DC-cancellation circuit.

Design Procedure

Select Photodiode

Noise performance and bandwidth are adversely affected by capacitance on the TIA input node. Select a low-capacitance photodiode to minimize the total input capacitance on this pin. The MAX3793 is optimized for 0.6pF of capacitance on the input.

Select C_{FILT}

The filter resistor of the MAX3793, combined with an external capacitor, can be used to reduce noise (see the *Typical Application Circuit*). Current generated by supply noise voltage is divided between C_{FILT} and C_{IN} . Assuming the filter capacitor is much larger than the photodiode capacitance, the input noise current due to supply noise is:

$$I_{NOISE} = (V_{NOISE} \times C_{IN}) / (R_{FILT} \times C_{FILT})$$

1Gbps to 4.25Gbps Multirate Transimpedance Amplifier with Photocurrent Monitor

If the amount of tolerable noise is known, the filter capacitor can be easily selected:

$$C_{\text{FILT}} = (V_{\text{NOISE}} \times C_{\text{IN}}) / (R_{\text{FILT}} \times I_{\text{NOISE}})$$

For example, with maximum noise voltage = 100mV_{P-P}, C_{IN} = 0.6pF, R_{FILT} = 750Ω, and I_{NOISE} at 350nA, the filter capacitor is:

$$C_{\text{FILT}} = (100\text{mV} \times 0.6\text{pF}) / (750\Omega \times 350\text{nA}) = 229\text{pF}$$

Select R_{MON}

If photocurrent monitoring is desired, connect a resistor between MON and ground to monitor the average photocurrent. Select the largest R_{MON} possible:

$$R_{\text{MON}} = \frac{2.0\text{V}}{I_{\text{MONMAX}}}$$

where, I_{MONMAX} is the largest average input current observed. An ammeter can also be used to monitor the current out of the MON pin.

Layout Considerations

Figure 3 shows suggested layouts for 4-pin and 5-pin TO headers.

Wire Bonding

For high-current density and reliable operation, the MAX3793 uses gold metalization. For best results, use gold-wire ball-bonding techniques. Exercise caution if attempting wedge bonding. The die size is 30 mils x 50 mils (0.762mm x 1.27mm), and the die thickness is 15 mils (380μm). Bond-pad size for the V_{CC}, GND, OUT+, and OUT- pads is 94μm x 94μm. Bond-pad size for the FILT, IN, and MON pads is 79μm x 79μm; all bond-pad metal thickness is 1.2μm. Refer to Maxim Application Note HFAN-08.0.1: *Understanding Bonding Coordinates and Physical Die Size* for additional information on bond-pad coordinates. Recommended bonding sequence is shown in Figure 4.

Applications Information

Optical Power Relations

Many of the MAX3793 specifications relate to the input signal amplitude. When working with optical receivers, the input is sometimes expressed in terms of average optical power and extinction ratio. Figure 5 and Table 1 show relations that are helpful for converting optical power to input signal when designing with the MAX3793.

Optical Sensitivity Calculation

The input-referred RMS noise current (I_N) of the MAX3793 generally determines the receiver sensitivity.

Figure 5. Optical Power Relations

Table 1. Optical Power Relations*

PARAMETER	SYMBOL	RELATION
Average power	P_{AVG}	$P_{AVG} = (P_0 + P_1) / 2$
Extinction ratio	r_e	$r_e = P_1 / P_0$
Optical power of a 1	P_1	$P_1 = 2P_{AVG} \frac{r_e}{r_e + 1}$
Optical power of a 0	P_0	$P_0 = 2P_{AVG} / (r_e + 1)$
Optical modulation amplitude	P_{IN}	$P_{IN} = P_1 - P_0 = 2P_{AVG} \frac{r_e - 1}{r_e + 1}$

*Assuming a 50% average mark density.

To obtain a system bit-error rate (BER) of $1E-12$, the signal-to-noise ratio must always exceed 14:1. The input sensitivity, expressed in average power, can be estimated as:

$$\text{Sensitivity} = 10 \log \left(\frac{14.1 \times I_N (r_e + 1)}{2 \times \rho \times (r_e - 1)} \times 1000 \right) \text{ dBm}$$

where, ρ is the photodiode responsivity in A/W, and I_N is the RMS noise current in amps.

Input Optical Overload

Overload is the largest input that the MAX3793 accepts while meeting DJ specifications. Optical overload can be estimated in terms of average power with the following equation:

$$\text{Overload} = 10 \log \left(\frac{I_{OL}}{2 \times \rho} \times 1000 \right) \text{ dBm}$$

Optical Linear Range

The MAX3793 has high gain, which limits the output when the input signal exceeds $50\mu\text{A}_{P-P}$. The MAX3793 operates in a linear range for inputs not exceeding:

$$\text{Linear Range} = 10 \log \left(\frac{50\mu\text{A} \times (r_e + 1)}{2 \times \rho \times (r_e - 1)} \times 1000 \right) \text{ dBm}$$
