## RESETTABLE CIRCUIT PROTECTION

When it comes to Polymeric Positive Temperature Coefficient (PPTC) circuit protection, you now have a choice. If you need a reliable source, look to polymeric resettable fuses from SCHURTER.

Polymeric fuses are made from a conductive plastic formed into thin sheets, with electrodes attached to either side. The conductive plastic is manufactured from a non-conductive crystalline polymer and a highly conductive carbon black. The electrodes ensure even distribution of power through the device, and provide a surface for leads to be attached or for custom mounting.

The phenomenon that allows conductive plastic materials to be used for resettable overcurrent protection devices is that they exhibit a very large non-linear Positive Temperature Coefficient (PTC) effect when heated. PTC is a characteristic that many materials exhibit whereby resistance increases with temperature. What makes the polymeric conductive plastic material unique is the magnitude of its resistance increase. At a specific transition temperature, the increase in resistance is so great that it is typically expressed on a log scale.

## HOW POLYMERIC RESETTABLE OVERCURRENT PROTECTORS WORK

The conductive carbon black filler material in the polymeric device is dispersed in a polymer that has a crystalline structure. The crystalline structure densely packs the carbon particles into its crystalline boundary so they are close enough together to allow current to flow through the polymer insulator via these carbon “chains.”

When the conductive plastic material is at normal room temperature, there are numerous carbon chains forming conductive paths through the material.

Under fault conditions, excessive current flows through the polymeric device.  $I^2R$  heating causes the conductive plastic material's temperature to rise. As this self heating continues, the material's temperature continues to rise until it exceeds its phase transformation temperature. As the material passes through this phase transformation temperature, the densely packed crystalline polymer matrix changes to an amorphous structure. This phase change is accompanied by a small expansion. As the conductive particles move apart from each other, most of them no longer conduct current and the resistance of the device increases sharply.

The material will stay “hot,” remaining in this high resistance state as long as the power is applied. The device will remain latched, providing continuous protection, until the fault is cleared and the power is removed. Reversing the phase transformation allows the carbon chains to re-form as the polymer re-crystallizes. The resistance quickly returns to its original value.

## PRODUCT SELECTION

To select the correct polymeric circuit protection device, complete the information listed below for the application, and then refer to the resettable overcurrent protector data sheets.

## APPLICATIONS

The benefits of polymeric Resettable Overcurrent Protectors are being recognized by more and more design engineers, and new applications are being discovered every day.

The use of polymeric types of devices have been widely accepted in the following applications and industries:

1. Determine the normal operating current:  
\_\_\_\_\_ amps
2. Determine the maximum circuit voltage ( $V_{max}$ ): \_\_\_\_\_ volts
3. Determine the fault current ( $I_{max}$ ):  
\_\_\_\_\_ amps
4. Determine the operating temperature range:  
Minimum Temperature: \_\_\_\_\_ °C  
Maximum Temperature: \_\_\_\_\_ °C
5. Select a product family so that the maximum rating for  $V_{max}$  and  $I_{max}$  is higher than the maximum circuit voltage and fault current in the application.
6. Using the  $I_{hold}$  vs. Temperature Table on the product family data sheet, select the polymeric device at the maximum operating temperature with an  $I_{hold}$  greater than or equal to the normal operating current.
7. Verify that the selected device will trip under fault conditions by checking in the  $I_{trip}$  table that the fault current is greater than  $I_{trip}$  for the selected device, at the lowest operating temperature.
8. Order samples and test in application.

- Personal computers
- Laptop computers
- Personal digital assistants
- Transformers
- Small and medium electric motors
- Audio equipment and speakers
- Test and measurement equipment
- Security and fire alarm systems
- Medical electronics
- Personal care products
- Point-of-sale equipment
- Industrial controls
- Automotive electronics and harness protection
- Marine electronics
- Battery-operated toys

Schurter's resettable fuses cross to many like products already on the market. See our online cross list at [www.schurterinc.com/cross.htm](http://www.schurterinc.com/cross.htm).

# PFMD Polymeric PTC Resettable Fuse – Surface Mount

Typical Time to Trip at 23 °C

**NEW**

- High Density Circuit Board Application:  
Hard disk drives,  
PC motherboards  
PC peripherals  
Point-of-sale (POS) equipment  
PCMCIA cards

- Packaged per EIA 481-2 standard

**Approvals:**

UL recognition  
CSA pending approval  
TÜV approval

**Dimensions**

**Solder Pad Layouts**

**Typical Part Marking**

Represents total content. Layout may vary.

Dimensions in mm / (inch)

**Technical Data**

Operating/Storage Temperature	-40°C to +85°C	
Maximum Device Surface Temperature in Tripped State	125°C	
Passive Aging	+85°C, 1000 hours	±5% typical resistance change
Humidity Aging	+85°C, 85% R.H. 1000 hours	±5% typical resistance change
Thermal Shock	+125°C/-40°C 10 times	±10% typical resistance change
Mechanical Shock	MIL-STD-202, Method 213, Condition 1 (100g, 6 seconds)	No resistance change
Solvent Resistance	MIL-STD-202, Method 215	No change
Vibration	MIL-STD-883C, Method 2007.1, Condition A	No change
Terminal material	Solder-plated copper	
Termination pad solderability	Meets EIA Specification RS-186-9E, ANSI/J-STD-002 Cat.3	

**Test Procedures And Requirements**

Test	Test Conditions	Accept/Reject Criteria
Visual/Mech.	Verify dimensions and materials	Per PF physical description
Resistance	In still air @ 23°C	$R_{min} \leq R \leq R_{max}$
Time to Trip	At 8 Amps, $V_{max}$ , 23°C	$T \leq \text{max. time to trip (seconds)}$
Hold Current	30 min. at $I_{hold}$	No trip
Trip Cycle Life	$V_{max}$ , $I_{max}$ , 100 cycles	No arcing or burning
Trip Endurance	$V_{max}$ , 48 hours	No arcing or burning

### How to Order

PFMD.020.2

### Solder Reflow And Rework Recommendations

- Packaging options:
- TAPE & REEL: PFMD.035.2 = 3000 pcs per reel  
All other models = 1500 pcs. per reel.

### NOTE:

- PFMD models can be waved soldered and reworked.
- If reflow temperatures exceed the recommended profile, devices may not meet the performance requirements.

## Solder Reflow And Rework Recommendations

### Solder reflow

- Recommended reflow methods: IR, vapor phase oven, hot air oven.
- Devices are not designed to be wave soldered to the bottom side of the board.
- Gluing the devices is not recommended.
- Recommended maximum paste thickness is 0.25 mm (.010 inch).
- Devices can be cleaned using standard industry methods and solvents.

Note: If reflow temperatures exceed the recommended profile, devices may not meet the performance requirements

### Rework

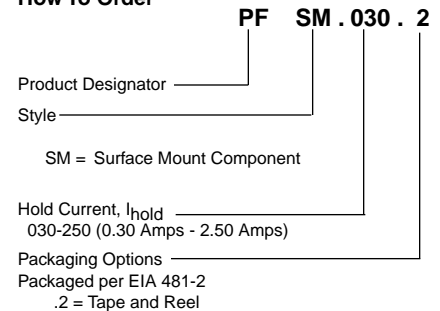

- A device should not be reworked.

## Packaging options

**BULK:** PFRA.010-PFRA.185 = 500 pcs. per bag; PFRA.250-PFRA.900 = 100 pcs. per bag;  
(leave.X space) PFRA.090.X.009 & PFRA.250.X.010 = 500 pcs. per bag.

**TAPE & REEL:** PFRA.010-PFRA.160 - 12.7mm device pitch = 3000 pcs. per reel;  
X=.2 PFRA.185-PFRA.400 - 25.4mm device pitch = 1500 pcs. per reel;  
PFRA.090.X.009 & PFR.A250.X.010 = 3000 pcs. per reel.

**AMMO-PACK:** PFRA.010-PFRA.160 - 12.7mm device pitch = 2000 pcs. per reel;  
X=.3 PFRA.185-PFRA.400 - 25.4mm device pitch = 1000 pcs. per reel;  
PFRA.090.X.009 & PFRA.250.X.010 = 2000 pcs. per reel.

# PFRA Tape and Reel Specifications

Devices taped using EIA468-B/IEC286-2 standards. See table below and Figures 1 and 2 for details.

Dimension Description	IEC Mark	EIA Mark	Dimensions	
			Dim. (mm)	Tol. (mm)
Carrier tape width	<i>W</i>	<i>W</i>	18	-0.5/+1.0
Hold down tape width		<i>W4</i>	5	min.
Hold down tape	<i>W0</i>		No protrusion	
Top distance between tape edges	<i>W2</i>	<i>W6</i>	3	max.
Sprocket hole position	<i>W1</i>	<i>W5</i>	9	-0.5/+0.75
Sprocket hole diameter	<i>D0</i>	<i>D0</i>	4	± 0.2
Abscissa to plane (straight lead)	<i>H</i>	<i>H</i>	18.5	± 3.0
Abscissa to plane (kinked lead)	<i>H0</i>	<i>H0</i>	16	± 0.5
Abscissa to top	<i>H1</i>	<i>H1</i>	32.2	max.
Overall width w/lead protrusion		<i>C1</i>	43.2	max.
Overall width w/o lead protrusion		<i>C2</i>	42.5	max.
Lead protrusion	<i>I1</i>	<i>L1</i>	1.0	max.
Protrusion of cutout	<i>L</i>	<i>L</i>	11	max.
Protrusion beyond hold tape	<i>I2</i>	<i>I2</i>	Not specified	
Sprocket hole pitch	<i>P0</i>	<i>P0</i>	12.7	± 0.3
Pitch tolerance			20 seconds	± 1
Device pitch: PFRA.010 – PFRA.160			12.7	
Device pitch: PFRA.185 – PFRA.400			25.4	
Tape thickness	<i>t</i>	<i>t</i>	0.9	max.
Tape thickness with splice		<i>t1</i>	2.0	max.
Splice sprocket hole alignment			0	± 0.3
Body lateral deviation	$\Delta h$	$\Delta h$	0	± 1.0
Body tape plane deviation	$\Delta p$	$\Delta p$	0	± 1.3
Lead seating plane deviation	$\Delta P1$	<i>P1</i>	0	± 0.7
Lead spacing	<i>F</i>	<i>F</i>	5.08	± 0.8
Reel width	<i>w</i>	<i>w</i>	56	max.
Reel diameter	<i>d</i>	<i>a</i>	370	max.
Space between flanges less device			4.75	± 3.25
Arbor hole diameter	<i>f</i>	<i>c</i>	26	± 12.0
Core diameter	<i>h</i>	<i>n</i>	80	max.
Box			56/372/372	max.
Consecutive missing places			3 maximum	
Empty places per reel			Not specified

# PFRX Polymeric PTC Resettable Fuse - Radial Leaded

Typical Time to Trip at 23°C

**NEW**

- Cured, flame retardant epoxy polymer insulating material meets UL 94V-0 requirements
- Bulk packaging, tape and reel and Ammo-Pak available on most models
- Applications: Almost anywhere there is a low voltage power supply, up to 60V and a load to be protected, including: computers & peripherals, general electronics, automotive applications

**Approvals:**

- UL recognition, file #E172175 (60V)
- CSA acceptance, file #CA702083 (60V)
- TÜV certification, file #R9872200 (60V)

**Package 1**

Lead Material  
0.81 dia. (20AWG)

NOTE: Kinked lead option is available for board standoff. Contact factory for details.

**Typical Part Marking**

Represents total content. Layout may vary.

**Technical Data**

Operating/Storage Temperature	-40°C to +85°C	
Maximum Device Surface Temperature in Tripped State	125°C	
Passive Aging	+85°C, 1000 hours	±5% typical resistance change
Humidity Aging	+85°C, 85% R.H. 1000 hours	±5% typical resistance change
Thermal Shock	+125°C/-40°C 10 times	±10% typical resistance change
Mechanical Shock	MIL-STD-202, Method 213, Condition 1 (100g, 6 seconds)	No resistance change
Solvent Resistance	MIL-STD-202, Method 215	No change
Vibration	MIL-STD-883C, Method 2007.1, Condition A	No change

**Test Procedures And Requirements**

Test	Test Conditions	Accept/Reject Criteria
Visual/Mech.	Verify dimensions and materials	Per PF physical description
Resistance	In still air @ 23°C	$R_{min} \leq R \leq R_{max}$
Time to Trip	5 times Ihold, Vmax, 23°C	T ≤ max. time to trip (seconds)
Hold Current	30 min. at Ihold	No trip
Trip Cycle Life	Vmax, Imax, 100 cycles	No arcing or burning
Trip Endurance	Vmax, 48 hours	No arcing or burning

## About Non-Resettable Fuses

### How to Specify Fuses:

The safety of electronic and electric equipment not only depends upon the use of shock-safe primary circuit components (fuseholders, voltage selector switches, power entry modules, etc.) designed primarily for the protection of service personnel, but also on devices protecting the safe operation of the equipment itself. Since in many cases fuses are the only means of providing circuit protection in the event of overloads or fault conditions, we suggest the following considerations be observed when fuses are being selected.

### 1. Fuse Standards

There are three principal standards a fuse can be designed to:  
 1) UL 248-14 2) CSA 22.2 No. 59 3) IEC 127

Please note that these standards may not necessarily be compatible with each other. The main difference between the various standards are as follows:

- different blowing characteristics between UL/CSA and IEC standards
- different temperature rise requirements between UL and CSA standards

The incompatibility of these standards makes it impossible to use one and the same fuse across the world in a given application. Attention needs to be given to the fact that the governing Standard in Europe is IEC. Observation of this fact in the early design stage will save trouble and confusion during the agency approval process. Note: new fuse qualifications have been established for low-voltage fuses; reference EIA/IS-722.

### 2. Approval Agencies

National approval agencies which approve miniature type fuses conforming to either UL, CSA, or IEC standards are: UL (USA), CSA (Canada), VDE (Germany), SEMKO (Sweden), BSI (United

Kingdom). It is important to understand that UL and CSA not only write standards but also issue conformance approvals. IEC, however, limits itself to writing the standards. Conformance with these IEC standards is tested by VDE, SEMKO, and BSI.

A UL approved fuse will either bear the listing or the recognized mark. A listed fuse meets all the requirements of fuse Standard UL 248-14. A fuse with the recognition mark is tested under the Component Program of UL to the fuse manufacturer's own specifications.

CSA now has an equivalent to the Recognized Component Program of UL: CSA Component Acceptance . As far as fuse size is concerned, UL and CSA accept a wide range of dimensions (including the 5 x 20mm size, notably with UL/CSA blowing characteristics!) IEC has standardized around the 5 x 20mm size (notably with IEC blowing characteristics!). The only other size in IEC's document is the 1/4 x 1 1/4" fuse (only in quick acting, low breaking capacity configuration).

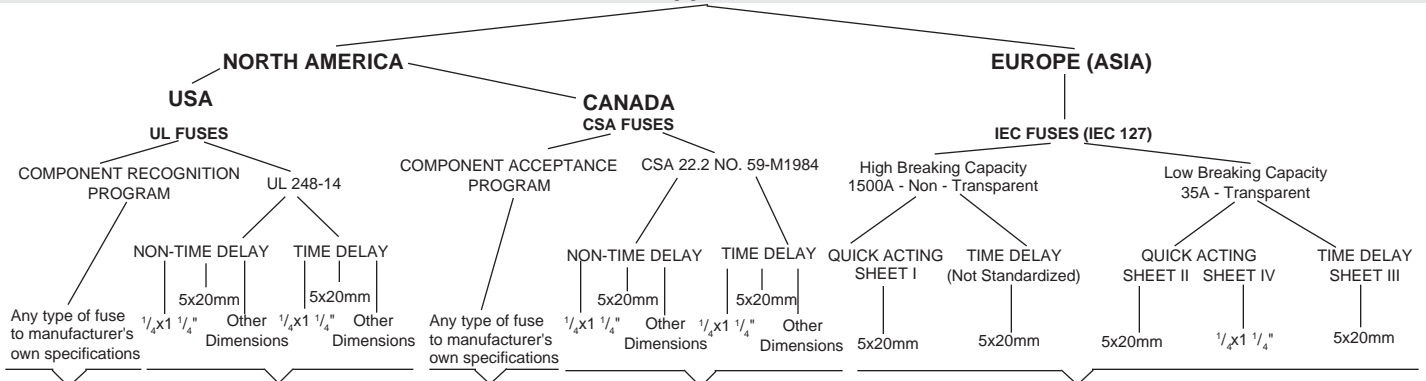

Because of overlapping dimensions between the various standards, caution has to be used when trying to categorize or identify a 5 x 20mm or 1/4 x 1 1/4" fuses. The chart below summarizes the aforementioned.

**IMPORTANT:** All CENELEC (European Committee for Electronic Standards) countries, including EC and EFTA nations, require a high-breaking capacity fuse-link, if the short circuit current through the fuse-link is more than 35A or 10 x I<sub>n</sub>, whichever is greater, effective January 1st, 1993. Please refer to **Series SP (pg. 145)** and **SPT (pg. 148)**.

### 3. Rated Current

The rated current of the fuse should be in accordance with the operating current of the equipment to be protected. Consideration

## About Non-Resettable Fuses, continued

needs to be given to the fact that the current carrying capacity of a fuse is affected by changes in ambient temperature. IEC and UL/CSA tests are performed at 23°C and 25°C respectively. In practical applications the fuse's ambient temperature may be significantly higher, especially if the fuse is used in an enclosed type fuseholder or mounted near other heat generating components. The effect of changes in the ambient temperature is shown in the chart below.

In addition to the effect of ambient temperature conditions, it is recommended to also de-rate UL listed fuses by approximately 25% of the original current ratings. This is, however, not required for IEC fuses (See Para. 10).

### 4. Rated Voltage

The rated voltage of the fuse should be in no case lower than the operating voltage. At low operating voltage, the inherent resistance must be considered.

Please note that UL and CSA require the use of 250V rated fuses in Power Entry Modules.

### 5. Breaking Capacity/Short Circuit Rating

The breaking capacity is the short-circuit current which the fuse can break at the rated voltage under the advanced conditions without being destroyed or causing permanent arcing.

Under IEC, miniature type fuses are classified into two categories:

#### Fuses with Low Breaking Capacity

Typically, the fuse-element of a fuse with low breaking capacity is visible. The insulation tube consists of transparent material, normally glass. There is no extinguishing medium, the arc is quenched in air. The breaking capacity at 250 V and a power factor of 1 is 35 A.

#### Fuses with High Breaking Capacity

The fuse-element of a fuse with high breaking capacity is not visible. The insulation tube normally is of ceramic material or glass. To quench the arc, there is always an extinguishing medium. The breaking capacity at 250 V and a power factor of .7 to .8 is 1500 A.

UL's and CSA's short circuit requirements are similar, but different as relates to IEC. At 125 V a UL listed fuse has to interrupt 10,000 Amps AC, whereas at 250 V the range may vary from 35 Amps up to 1500 Amps depending on the specific current rating of the fuse.

### 6. Breaking Characteristic

The breaking characteristic is shown in the respective time-current blowing charts for each fuse type. The breaking characteristic is the melting time of a fuse given a defined load. The melting time is a function of the fuse wire length and diameter as well as its base material and alloy.

IEC fuses are classified as follows:

#### Quick-Acting Fuses

Application: Protection of semiconductors and for very sensitive instruments. This fuse type tolerates small overcurrents for a short period of time but breaks very quickly at higher current values. It limits short circuit currents at a very early stage.

#### Time-Lag Fuses

Application: Protection of devices subjected to moderate to high in-rush currents and/or overcurrent peaks, such as transformers and motors. This type of fuse also tolerates higher overcurrents during a short period of time.

UL/CSA fuses are divided into:

#### Non Time Delay Fuses

These fuses are sometimes also referred to as Normal Blow types.

#### Time Delay Fuses

These fuses are sometimes also referred to as Slow Blow or Surge Proof types.

For certain applications neither of the above described types may prove usable. Since the writing of Standards by IEC/UL/CSA does not always keep pace with the latest technological advances various fuse manufacturers have developed fuses outside the realm of such standards.

Generally the agencies allow the use of such fuses if a particular application dictates it. The OEM's risks are that it has to rely on manufacturer's own specifications that are not routinely checked by a safety agency. Schurter offers the following use types for such purposes:

#### Super Quick-Acting Fuses

Application: Protection of semiconductors at the base of S1 and GE (thyristors, triacs, diodes). This fuse type tolerates small overcurrents only during a short period of time and limits the current at small short-circuit currents.

#### Medium Time-Lag Fuses

Applications: Protection devices subjected to moderate to high in-rush currents and/or overcurrent peaks, such as transformers and motors. This fuse type also tolerates higher overcurrents during a short period of time. Due to its conformance with DIN Standard 41571, this fuse is widely used in Germany; mainly in government related applications.

#### Super Time-Lag Fuses

Application: Protection of devices subjected to longer lasting in-rush currents and/or high overcurrent peaks like transformers and motors. This type tolerates higher overcurrents during a longer period of time.

## About Non-Resettable Fuses, continued

### 7. Blowing Charts and Tables

This catalog differentiates between two types of blowing charts and tables: IEC and UL/CSA. Proper understanding of these differences is essential when one tries to match the fuse characteristics to the circuit requirements.

a) Chart and Table for IEC fuses: This chart is an interval graph showing a curve representing the minimum blowing times and another curve representing maximum values for a set of current ratings. The tables give the checkpoints or "gates" mandated by IEC. Please note that only the gate values are tested by the agencies. Values on the curve between two gates are geometrically arrived at and are not guaranteed by the manufacturer.

b) Chart and Table for UL/CSA listed fuses: The curves for this graph represent average values, individually for each current rating.

### 8. Fusing Integral I<sup>2</sup>t

The fusing integral is the thermal energy needed to melt the fuse-element. The fusing integral I<sup>2</sup>t is used to determine:

- the blowing time for higher overcurrents
- the aging behavior of a fuse caused by in-rush currents.

The formula given below is only valid for blowing periods of less than 10 ms.

$$t = \frac{I^2t}{(\text{overcurrent})^2} = \text{seconds} + 20\%$$

To prevent aging caused by in-rush currents we recommend staying within the following limits:

I <sup>2</sup> t of in-rush (to be determined by user)	less than 30% of fuse I <sup>2</sup> t for time delay fuses
	less than 40% of fuse I <sup>2</sup> t for normal blow fuses

The proper selection of a fuse requires that attention be given to this subject. Often times a fuse problem can only be pinpointed after a thorough study of this issue.

### 9. Power Dissipation

Power dissipation heats up the fuse and its surroundings. Especially when selecting fuseholders, it is important to ensure that, allowing for the ambient temperature, they are capable of absorbing sufficient dissipated power. Please refer to the power dissipation sections on the individual fuse pages when selecting a fuse.

### 10. Specification of Characteristics

To quickly and easily classify the various fuse types by their time-current characteristics, the following letter codes are stamped on IEC, or other 5 x 20mm fuses.

		Letter Code
super quick-acting	=	FF
quick-acting	=	F
medium time-lag	=	M

time-lag	=	T
super time-lag	=	TT

Example of fuse markings: T200 mA / 250 V

UL listed and CSA certified fuses are not as easily identifiable because neither any lettering nor color code is required on the fuse itself.

### 11. Dimensions

Traditionally the dimensions have been 5 x 20mm for international type fuses and 1/4 x 1 1/4" (6.3 x 32mm) for domestic, Northern American fuses. Today however, IEC 5 x 20mm fuses with UL recognition and CSA Component Acceptance are becoming increasingly popular in North America, especially in applications where saving space is a major concern.

It should also be pointed out that the 5 x 20mm fuse is available at most over-the-counter distributors as well as radio supply shops in North America.

IEC fuses of the 1/4 x 1 1/4" size should not be used in North America. These fuses were designed for replacement use in American made equipment located in Europe.

### 12. Interchangeability of IEC Fuses with UL Fuses and Vice Versa

For general applications the rated current of the fuse to be converted should be multiplied/divided by a factor 2 depending on whether the fuse has to be converted from the use in a 250V circuit to the use in a 125V circuit or vice versa. In this case, however, the fuse normally doesn't provide anything more than short current protection. For a more accurate correlation, the time current characteristic curves of both the IEC and UL fuse must be compared. As a rule of thumb, a factor of 2.4 to 2.6 can be used to convert an IEC fuse (used in a 250V circuit) into a UL fuse (used in a 125V circuit) with the corresponding characteristics (e.g. a 1 A IEC fuse corresponds to a 2.5 A UL fuse).

### 13. Quality Control

Details about Schurter's strict quality control procedures are available upon request.

Should you need fuses for non-standard applications, please contact our Engineering Department.

Note: new fuse qualifications have been established for low-voltage fuses; reference EIA/IS-722.

# MGA 125V 125V Quick-acting Surface Mount Fuse

Built according to EIASOCM-3216 (equivalent to 1206), meets EIA/IS-722 fuse qualification standard.

**Approvals:**

UL recognition 200mA-3A<sup>1)</sup> File #E153466  
 CSA acceptance 200mA-3A<sup>1)</sup> File #LR51172  
<sup>1)</sup> 4A-5A approvals pending

**NEW**

- "Flip chip" design mounts on any side
- Lowest resistance
- Quick-acting
- Hermetically sealed for operating temperatures in excess of 150°C
- Low energy let-through
- Superior cycling

Reel diameter: 179mm (750 pieces & 3,000 pieces)

**Time Current Characteristics**

rated current $I_n$	$n \cdot I_n$	$I_n$	$2.5 \cdot I_n$
		$\geq 4 \text{ h}$	$\leq 5 \text{ s}$
200mA – 5A			

**Technical Data**

<b>Rated current</b>	see chart
<b>Time current characteristic</b>	quick-acting
<b>Interrupt capacity</b>	50 A AC, 300A DC
<b>Ambient temperature max.</b>	+150°C
<b>Climatic category</b>	hermetically sealed
<b>Solderability</b>	reflow: 260°C / 30 sec. max; wave: 260°C / 10 sec. max.
<b>Soldering heat resistance</b>	60 seconds above 200°C, max. 260°C
<b>Material: Housing</b>	ceramic
<b>Terminals</b>	nickel, tin-lead coated
<b>Packaging</b>	8mm tape and reel per EIA-RS481 (equivalent to IEC 286-3)

Order Numbers – Standard	Rated current / voltage mA / A / V ~	Breaking capacity A ~ ac / dc	Voltage drop at $I_n$ typical mV	Resistance at 10% $I_n$ Ohms	Fusing Integral typ. $A^2s$	Packaging Order No. Suffix

# MGL 125V Quick-acting Miniature Fuse

**NEW**

**Approvals:**

UL recognition<sup>1)</sup> 200mA-3A<sup>2)</sup> File #E153466  
 CSA acceptance 200mA-3A<sup>2)</sup> File #LR51172  
 1) reference series 1020 2) 4A-5A approvals pending

Note: dimensions are in mm

- Mounting holes as close as .2 inch
- Lowest resistance
- Quick-acting
- Hermetically sealed for operating temperatures in excess of 150°C
- Superior cycling

**Time Current Characteristics**

rated current $I_n$	$n \cdot I_n$	$I_n$	$2.5 \cdot I_n$
	200mA – 5A	$\geq 4$ h	$\leq 5$ s

**Technical Data**

<b>Rated current</b>	see chart
<b>Time current characteristic</b>	quick-acting
<b>Breaking capacity</b>	50A AC, 300 A DC

For protection of semiconductors, ask for special catalog (reference super quick-acting fuse series D GLD II / III 0034.1101 - .1115, 2A-6A/500V)

For pigtail fuses packaged loose: reference .PT after part number (e.g. 0034.0903.PT)  
For pigtail fuses on 1,000-piece tape and reel: reference .TR after part number (e.g. 0034.0903.TR)

# SP 5 x 20mm Quick-acting Fuses – High Breaking Capacity

Built according to IEC 127-2/1, EN 60127, SEV 1064, DIN/VDE 0820 part 1, DIN 41660, BS 4265, and SEMKO 104-1976. Recommended if the short circuit current through the fuse-link is more than 35A or 10 x I<sub>n</sub>, whichever is greater (CENELEC Jan 1, 1993).

**Approvals:**

\*Not mentioned in DIN 41571. Check temperature rise if fuses are used in closed type fuseholders.

For pigtail fuses packaged loose: reference .PT after part number (e.g. 0034.2511.PT)

For pigtail fuses on 1,000-piece tape and reel: reference .TR after part number (e.g. 0034.2511.TR)

# SPT 5 x 20mm Time Lag Fuses – High Breaking Capacity

Built according to IEC 127-2/5, EN 60127, SEV 1064, and SEMKO 104-1976. Recommended if the short circuit current through the fuse-link is more than 35A or  $10 \times I_n$ , whichever is greater (CENELEC Jan 1, 1993).

## Surge Tolerant Fuses

### Application Notes

#### Introduction

Telecommunication equipment acts as a source for data exchange between subscribers. Communication takes place in various ways, e. g. telephone, FAX etc.

Distances between individual subscribers (man, machine) can vary significantly thereby subjecting network connections (overhead lines, signal cables) to various interferences caused by:

- Atmospheric interference, (lightning strike, switching operations)
- Interference by power induction (equalizing currents, vicinity of power cables)
- Direct contact with energy network (short-circuits)

#### Interference sources

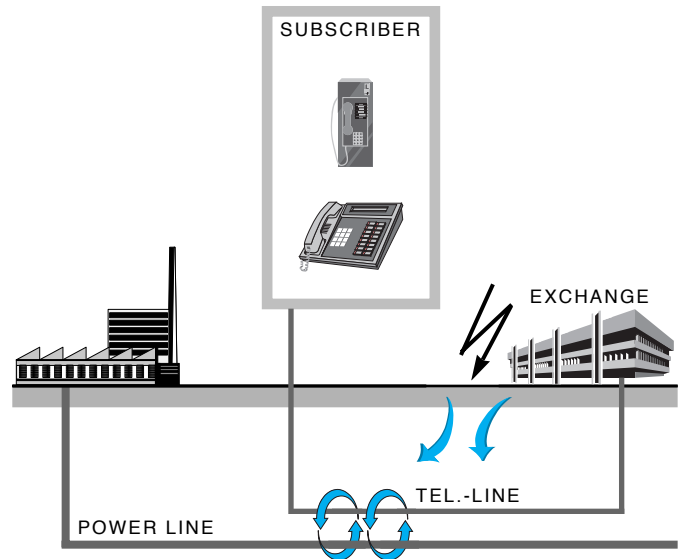

##### Atmospheric interference (Lightning Strike)

Interference due to lightning strikes occurs frequently on exposed overhead telephone lines. Voltages as a result of this atmospheric discharge can be 100 kV with discharge currents up to 150 kA.

#### Interference by induction (Power Induction)

Induction voltages occurring as interference on telecom lines are usually a result of circulating or equalizing currents in the earth or are produced by strong currents in adjacent power cables.

#### Direct contact with the power network (Power Contact)

Interference of unusually high intensity and long duration (a few seconds to several minutes) on a telephone line occurs when there is direct contact with a power network (e.g. short-circuit with an adjacent power cable).

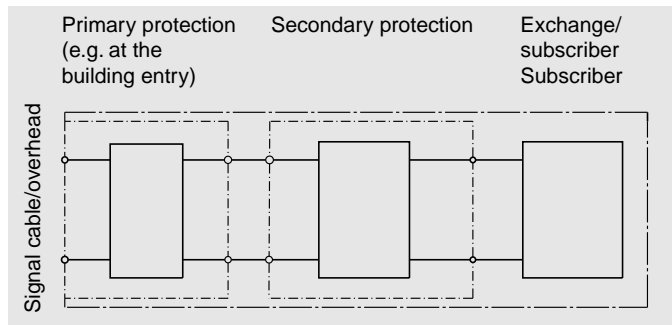

## Surge Tolerant Fuses

### Protection of equipment

Regardless of the type of interference affecting telecom equipment, it is imperative that no damage occurs, or only limited damage whose effects can be calculated.

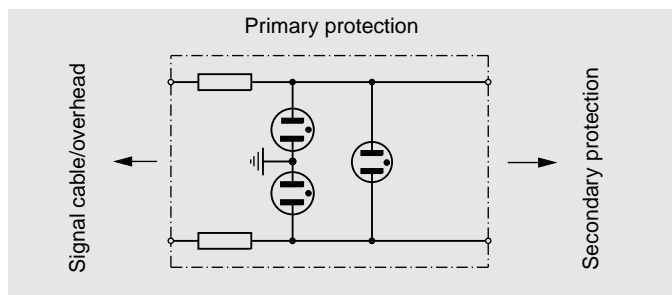

As shown below, this requirement can be satisfied by the use of appropriate protection circuits.

Protection circuits in the telecom branch are usually designed on the two-stage principle. They comprise of primary and secondary protection.

### Primary protection

Primary protection is frequently comprised of a combination of resistors and surge arrestors and is usually located at the «building entry» interface.

The task of the illustrated primary protection circuit is to sufficiently reduce the high-energy interference distortion so that it can be safely absorbed by the following secondary protection.

### Secondary protection

The secondary protection is normally located directly at the appliance entry of the telecom equipment and has two objectives.

1. It operates as a voltage limiter which ensures that interference up to a defined amplitude, not yet capable of activating the primary protection, is absorbed or reduced to a harmless level for the telecom equipment.
2. It effectively suppresses high energy level interferences, which can no longer be adequately absorbed by the primary protection (e.g. in case of direct contact between the signal lines and the power network), by galvanic decoupling of the circuit. This prevents the occurrence of serious damage, even fire, in the telecom equipment.

The following diagram shows a frequently used, extremely reliable protection circuit for this purpose.

The circuit, which in its simplest form is comprised of two fuses and two varistors, is characterized by an extremely attractive cost-benefit ratio. The varistors limit the interference voltage peaks to a level compatible for the telephone exchange, and respectively, the subscriber circuit. Under normal conditions, the fuses remain intact.

Under worst-case conditions, e.g. direct contact with the power network, where both the telecom equipment components and the varistors in the protection circuit would be seriously damaged or destroyed, the fuses interrupt the circuit thereby effectively and reliably protecting the telecom equipment.

# Surge Tolerant Fuses

## Testing: Introduction

Several standards have been established for the Telecom industry, all of which are aimed at combining the interference influences of Lightning Surge, Power Induction and Power Contact, together with the associated safety aspects, and to derive suitable testing methods for the components in question.

Various kinds of loads have been defined and standardised as testing criteria. They can be simulated with the aid of an appropriate test circuit. This provides circuit designers with the facility for optimally adapting the stages of a protection circuit to one another.

Current relevant standards are:

- ITU-T K.20** International Telecommunication Union, Standardisation Sector of ITU
- UL 1459/1950** Standard for Safety, Telephone Equipment (USA)
- GR 1089 Core** Bell Communications Research (USA)

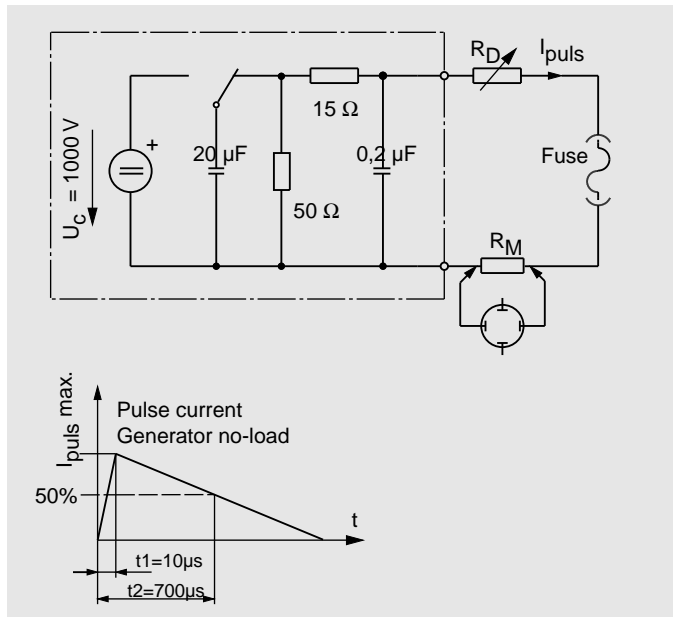

### Tests :

Schurter fuses have been tested according to the following standards and testing criteria (this list is not exhaustive):

## 1. ITU-T K.20

### Lightning Surge: Test circuit

Fig. 1

Test:

1. The pulse amplitude (generator no-load) is set to 1000 V and the pulse shape to 10 µs / 700 µs.
2. The pulse current  $I_{puls}$  is set to the value  $I_{puls\ max}$  stated in the data sheet with limiting resistor  $R_D$ .
3. Test mode : 10 single pulses, at an interval of 60 sec. alternating polarity.

Requirement: The fuse shall not interrupt the circuit.

### 1) Note:

With a charge voltage of  $U_C = 1000\ V$ , the standardized pulse generator in Fig. 1 supplies a maximum pulse current  $I_{puls} = 67\ A$ , providing the current limiting resistor is  $R_D = 0\ \Omega$ . The shunt  $R_M$  for the current monitoring has a very low resistance and has therefore no notable influence to the current amplitude. This means that the data sheet current 67 A (1) does not represent the maximum permissible pulse amplitude of the fuse in question, but the maximum current amplitude which can be supplied by the pulse generator. If a max. current higher than 67 A is to be expected in a circuit, the  $I^2t$ -values of the fuse can be calculated using the formula  $I^2t = 0,72 \times i^2_{peak} \times t_2$ , as a good approximation in order that the selected fuse can accept the expected current pulse without interrupting the circuit.

### Power induction: Test circuit

Fig. 2

Test: The fuse in the test circuit AC 300 V / 50 Hz is loaded 5

times with  $I_{eff} = 0,5\ A$  for 200 ms at intervals of 60 sec.

Requirement: The fuse shall not interrupt the circuit.

### Power Contact: Test circuit

Fig. 3

Test: The fuse in the test circuit AC 250 V / 50 Hz is loaded with the current value  $I_{sc}$  stated in the data sheet. The supply

voltage is maintained for 15 minutes.

Requirement: The fuse shall interrupt the circuit.

## Surge Tolerant Fuses

### 2. UL1459/1950

#### Test circuit

Fig. 4

#### Test 1:

The fuse in the test current circuit is loaded with a test current of  $I_{SC} = 40 \text{ A}$ . The AC 600 V / 50 Hz source voltage is applied for a total of 1.5 sec.

Requirement: The fuse shall interrupt the circuit.

#### Test 2:

The fuse in the test current circuit is loaded with a test current of  $I_{SC} = 7 \text{ A}$ . The AC 600 V / 50 Hz source voltage is applied for a total of 5 sec.

Requirement: The fuse shall interrupt the circuit.

#### Test 3

The fuse in the test current circuit is loaded with a test current of  $I_{SC} = 2,2 \text{ A}$ . The AC 600 V / 50Hz source voltage is applied for at least 30 minutes, or until stable thermal conditions are achieved in the telecom unit or until the fuse interrupts the circuit. This test is performed together with the equipment in which the fuse is installed.

### 3. GR 1089

#### Test circuit

Fig. 5

#### Test:

1. The pulse amplitude (generator no-load) is set to 1000 V and the pulse shape to 10  $\mu\text{s}$  / 1000  $\mu\text{s}$ .
2. The pulse current  $I_{puls}$  is set to the value  $I_{puls \text{ max.}}$  stated in the data sheet with limiting resistor  $R_D$ .
3. Test mode: 50 single pulses, at an interval of 60 sec. alternating polarity.

Requirement: The fuse shall not interrupt the circuit.

5) **Note:** With a charge voltage of  $U_C = 1000 \text{ V}$ , the standardized pulse generator in Fig. 5 supplies a maximum pulse current  $I_{puls} = 14 \text{ A}$ , providing the current limiting resistor is  $R_D = 0\Omega$ . The shunt  $R_M$  for the current monitoring has a very low resistance and has no notable influence to the current amplitude. This means that the data sheet current 14 A <sup>(5)</sup> does not represent the maximum permissible pulse amplitude of the fuse in question, but the maximum current amplitude which can be supplied by the pulse generator. If a max. current higher than 14 A is to be expected in a circuit, the  $I^2t$ - values of the fuse can be calculated using the formula  $I^2t = 0,72 \times i^2_{\text{peak}} \times t_2$ , as a good approximation in order that the selected fuse can accept the expected current pulse without interrupting the circuit.

# Surge Tolerant Surface Mount Fuses

## OSU 125 V fuses for surface mounting

can be soldered directly onto printed circuit board or inserted into surface mount fuseholder

especially for telecom applications

## OSU 250 V fuses for surface mounting

can be soldered directly onto printed circuit board or inserted into surface mount fuseholder

especially for telecom applications

# Surge Tolerant Cartridge Fuses

## TH1 5x20mm Thermofuses for telecom applications

Standards / Approvals  
none

### Pre-arcing time/current characteristic (at T<sub>a</sub> 23 °C)

Rated current I <sub>n</sub>	1,15 · I <sub>n</sub>		1,65 · I <sub>n</sub>		3 · I <sub>n</sub>		5 · I <sub>n</sub>		10 · I <sub>n</sub>		
	min.	max.	min.	max.	min.	max.	min.	max.	min.	max.	
2,5 A	1 h	1 h	1 s	60 s	0,3 s	10 s	30 ms				

### Wave characteristic 8 x 20 μs according to IEC 60-2

Type	Peak current admissible	
	1 Shock	10 Shocks
Thermolink TH1 / 2,50 A	2,5 kA	2 kA

### Technical data

- Resistance up to 8 x 20 μs current waves (IEC 60-2) of approx 1000 · I<sub>n</sub> without degradation
- Interrupting a short-circuit current of approx 1 · I<sub>n</sub>
- Thermal function: breaking the circuit from 145 °C

Construction	Glass tube
Weight	1,4 g
Climatic range	40 / 070 / 56
Majoration	1,45 · I <sub>n</sub> at 40 °C
Minoration	0,7 · I <sub>n</sub> at 70 °C
Vibrations	NF C 20-706 / IEC 68-2-6 10-55 Hz / 0,35 mm / 5 cycles
Shocks	NF C 20-727 / IEC 68-2-27, 50 g
Sinusoidal vibrations	NF C 20-729 / IEC 68-2-29, 40 g
Thermal function	160 °C / 100 mA / t ≤ 4000 s

Order No.	Rated current I <sub>n</sub> Rated voltage U <sub>n</sub>	Breaking capacity	Voltage drop at I <sub>n</sub> mV
7040.2120	AC 2,5 A / 220 V	AC 40 A / 220 V	200

### Thermal characteristics without current

### Telecom application example
