

# VND5050J-E VND5050K-E

## Double channel high side driver with analog current sense for automotive applications

### Features

#### General

Max supply voltage	V <sub>CC</sub>	41V
Operating voltage range	V <sub>CC</sub>	4.5 to 36V
Max On-State resistance (per ch.)	R <sub>ON</sub>	50 mΩ
Current limitation (typ)	I <sub>LIMH</sub>	19 A
Off state supply current	I <sub>S</sub>	2 μA <sup>(*)</sup>

(\*) Typical value with all loads connected

#### Application

- All types of resistive, inductive and capacitive loads

#### Main

- Inrush current active management by power limitation
- Very low stand-by current
- 3.0V CMOS compatible input
- Optimized electromagnetic emission
- Very low electromagnetic susceptibility
- In compliance with the 2002/95/ec european directive

#### Diagnostic Functions

- Open drain status output
- On state open load detection
- Off state open load detection
- Thermal shutdown indication

#### Protections

- Undervoltage shut-down
- Overvoltage clamp
- Output stuck to V<sub>CC</sub> detection
- Load current limitation

### Order codes

Package	Part number (Tube)	Part number (Tape & Reel)
PowerSSO-12	VND5050J-E	VND5050J-E13TR
PowerSSO-24	VND5050K-E	VND5050K-E13TR

- Self limiting of fast thermal transients
- Protection against loss of ground and loss of V<sub>CC</sub>
- Thermal shut down
- Reverse battery protection (see [Figure 28](#))
- Electrostatic discharge protection

### Description

The VND5050K-E and VND5050J-E is a monolithic device made using STMicroelectronics VIPower M0-5 technology. It is intended for driving resistive or inductive loads with one side connected to ground. Active V<sub>CC</sub> pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility table). The device detects open load condition both in on and off state, when STAT\_DIS is left open or driven low. Output shorted to V<sub>CC</sub> is detected in the off state.

When STAT\_DIS is driven high, STATUS pin is in high impedance state.

Output current limitation protects the device in overload condition. In case of long overload duration, the device limits the dissipated power to safe level up to thermal shut-down intervention. Thermal shut-down with automatic restart allows the device to recover normal operation as soon as fault condition disappears..

$V_{DEMAG}$	Turn-off output voltage clamp	$I_{OUT}=2A$ ; $V_{IN}=0$ ; $L=6\text{mH}$	$V_{CC}-41$	$V_{CC}-46$	$V_{CC}-52$	V
$V_{ON}$	Output voltage drop limitation	$I_{OUT}=0.1A$ ; $T_j = -40^{\circ}C \dots +150^{\circ}C$ (see <a href="#">Figure 6</a> )		25		mV

(1) To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles

**Table 8. Openload Detection**

Symbol	Parameter	Test Conditions	Min	Typ	Max	Unit
$I_{OL}$	Openload ON State Detection Threshold	$V_{IN} = 5V, 8V < V_{CC} < 18V$	10	See <a href="#">Figure 19</a>	70	mA
$t_{DOL(on)}$	Openload ON State Detection Delay	$I_{OUT} = 0A, V_{CC} = 13V$ (see <a href="#">Figure 4</a> )			200	$\mu s$

### 3 Application information

Figure 28. Application schematic

#### 3.1 GND protection network against reverse battery

##### 3.1.1 Solution 1:

Resistor in the ground line ( $R_{GND}$  only). This can be used with any type of load.

The following is an indication on how to dimension the  $R_{GND}$  resistor.

1.  $R_{GND} \leq 600\text{mV} / (I_{S(on)max})$ .
2.  $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where  $-I_{GND}$  is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power Dissipation in  $R_{GND}$  (when  $V_{CC} < 0$ : during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where  $I_{S(on)max}$  becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the  $R_{GND}$  will produce a shift ( $I_{S(on)max} * R_{GND}$ ) in the input thresholds and the status output values. This shift will vary depending on how many devices are ON in the case of several high side drivers sharing the same  $R_{GND}$ .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize Solution 2 (see below).

### 3.1.2 Solution 2:

A diode ( $D_{GND}$ ) in the ground line.

A resistor ( $R_{GND}=1k\Omega$ ) should be inserted in parallel to  $D_{GND}$  if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network will produce a shift ( $\approx 600mV$ ) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

## 3.2 Load dump protection

$D_{ld}$  is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds the  $V_{CC}$  max DC rating. The same applies if the device is subject to transients on the  $V_{CC}$  line that are greater than the ones shown in the ISO 7637-2: 2004(E) table.

## 3.3 $\mu C$ I/Os protection:

If a ground protection network is used and negative transients are present on the  $V_{CC}$  line, the control pins will be pulled negative. ST suggests to insert a resistor ( $R_{prot}$ ) in line to prevent the  $\mu C$  I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of  $\mu C$  and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of  $\mu C$  I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For  $V_{CCpeak} = -100V$  and  $I_{latchup} \geq 20mA$ ;  $V_{OH\mu C} \geq 4.5V$

$$5k\Omega \leq R_{prot} \leq 180k\Omega$$

Recommended values:  $R_{prot} = 10k\Omega$ ,  $C_{EXT} = 10nF$ .

## 3.4 Open load detection in off state

Off state open load detection requires an external pull-up resistor ( $R_{PU}$ ) connected between OUTPUT pin and a positive supply voltage ( $V_{PU}$ ) like the +5V line used to supply the microprocessor.

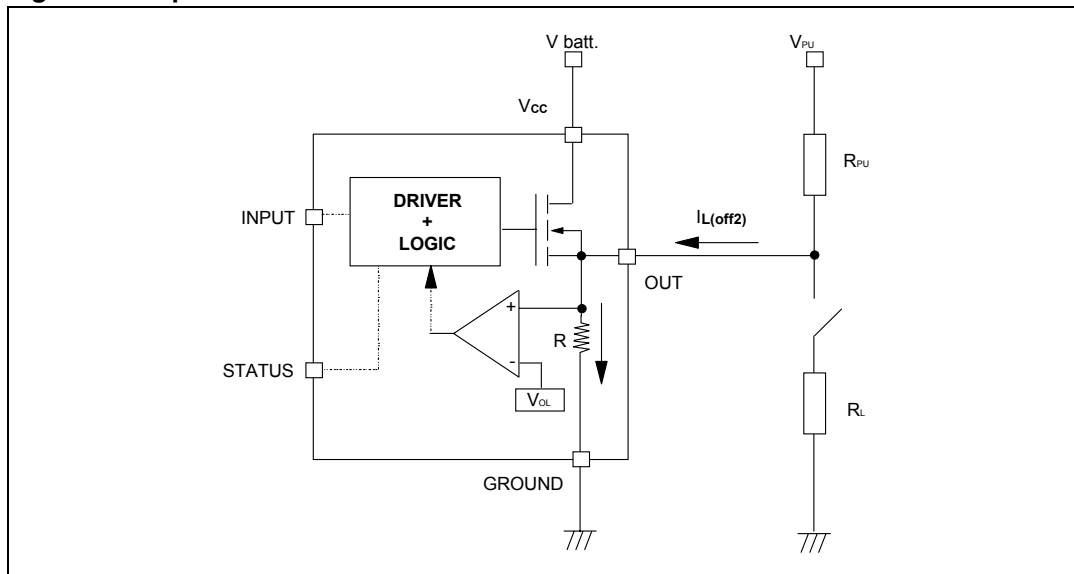

The external resistor has to be selected according to the following requirements:

- no false open load indication when load is connected: in this case we have to avoid  $V_{OUT}$  to be higher than  $V_{OLmin}$ ; this results in the following condition  $V_{OUT} = (V_{PU} / (R_L + R_{PU})) R_L < V_{OLmin}$ .
- no misdetection when load is disconnected: in this case the  $V_{OUT}$  has to be higher than  $V_{OLmax}$ ; this results in the following condition  $R_{PU} < (V_{PU} - V_{OLmax}) / I_{L(off2)}$ .

Because  $I_{S(OFF)}$  may significantly increase if  $V_{out}$  is pulled high (up to several mA), the pull-up resistor  $R_{PU}$  should be connected to a supply that is switched OFF when the module is in standby.

The values of  $V_{OLmin}$ ,  $V_{OLmax}$  and  $I_{L(off2)}$  are available in the Electrical Characteristics section.

**Figure 29. Open Load detection in off state**

## 5 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second-level interconnect. The category of Second-Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97.

The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).
