Description

Pericom Semiconductor's PI3HDMI411AD, active-drive switch solution is targeted for high-resolution video networks that are based on DVI/HDMI standards, and TMDS signal processing. The PI3HDMI411AD is an active single TMDS channel re-driver with Hi-Z outputs. The device drives differential signals with enhanced signal integrity to video display units. It provides three controllable output swing levels that can be controlled through pin control or I^2C control, depending on the mode select pin. The swing levels are 500mV, 700mV, & 1000mV. This solution also provides a unique advanced pre-emphasis technique to increase rise and fall times which are reduced during transmission across long distances.

The maximum DVI/HDMI data rate of 2.5Gbps provides a 1920x1080 resolution required w/ 12 bit/channel color depth, by the next Gen HDTV and PC graphics products.

PI3HDMI411AD is the industry's first active DVI/HDMI compliant switch, which ensures transmitting high bandwidth video streams from PC graphics source to end display units.

The Optimized Equalization provides the user a single optimal setting that can provide HDMI compliance for all cable lengths: 2meter, 10meter, 15meter, and 20 meter. Pericom also offers the ability to fine tune the equalization settings in situations where cable length is known.

Application Information

PI3HDMI411AD can be used to re-drive HDMI or DVI signals across internal cables or long FR4 trace lengths.

If a DTV is designed with a side/front HDMI connector, a Separate daughter card is needed for the side/front HDMI connector and Pericom re-driver.

ATC compliance MUST only be maintained from the front/side connector to the PI3HDMI411AD IC. After the PI3HDMI411AD signal Integrity will be taken care of through the powerful pre-emphasis technique of the Pericom solution.
