
155 Mb/s Single Mode Fiber Transceiver for ATM, SONET OC3/SDH STM-1

Technical Data

HFCT-5201

Features

- 1300 nm Single Mode Transceiver for Links up to 15 Km
- Compliant with ATM Forum 155 Mb/s Physical Layer Specification AF-PHY-0046.000
- Compliant with Specifications Proposed to ANSI T1E1.2 Committee for Inclusion in T1.646-1995 Broadband ISDN and T1E1.2/96-002 SONET Network to Customer Installation Interface Standards
- Compliant with Specifications Proposed to ANSI T1X1.5 Committee for Inclusion in T1.105.06 SONET Physical Layer Specifications Standard
- Multisourced 2 x 9 Pin-out Package Style Derived from 1 x 9 Pin-out Industry Standard Package Style
- Integral Duplex SC Connector Receptacle Compliant with TIA/EIA and IEC Standards
- Laser Bias Monitor, Power Monitor and Transmitter Disable Functions Compliant with SONET Objectives
- Two Temperature Ranges: 0°C - + 70°C HFCT-5201B/D -40°C - + 85°C HFCT-5201A/C
- Single +5 V Power Supply Operation and PECL Logic Interfaces
- Wave Solder and Aqueous Wash Process Compatible
- Manufactured in an ISO 9001 Certified Facility
- Considerable EMI Margin to FCC Class B

Applications

- ATM 155 Mb/s Links
- SONET OC3/SDH STM-1 Interconnections

Description

General

The HFCT-5201 is a 1300 nm laser based transceiver. It provides a very cost-effective solution to the medium haul 155 Mb/s data link requirements.

The new multisourced 2 x 9 footprint package style is a variation of the standard 1 x 9 package with an integral Duplex SC connector receptacle. The extra row of 9 pins provides connections for laser bias and optical power monitoring as well as providing transmitter disable function. A block diagram is shown in Figure 1.

Transmitter Section

The transmitter section of the HFCT-5201 consists of a 1300 nm InGaAsP laser in an eyesafe optical sub-assembly (OSA) which mates to the fiber cable. The laser OSA is driven by a custom, silicon bipolar IC which

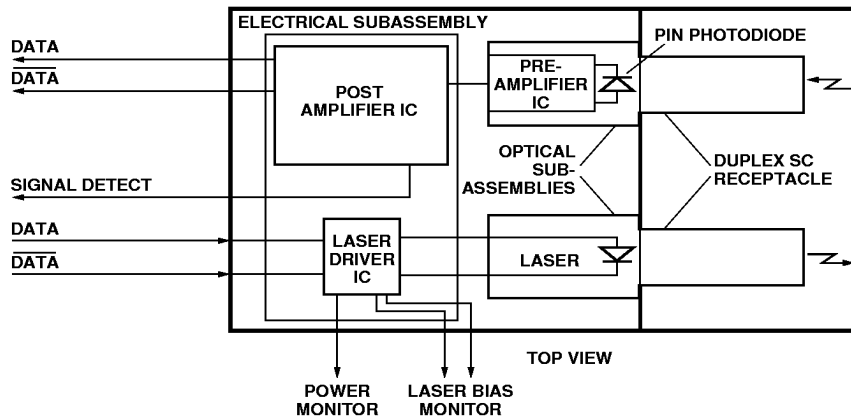

Figure 1. Block Diagram.

converts differential input PECL logic signals, ECL referenced to a +5 V supply, into an analog laser drive current.

The laser bias monitor circuit is shown in Figure 2a, the power monitor circuit in Figure 2b.

Receiver Section

The receiver utilizes an InGaAs PIN photodiode mounted together with a silicon bipolar transimpedance pre-amplifier IC in an OSA. This OSA is connected to a silicon bipolar circuit providing post-amplification quantization, and optical signal detection.

The post amp circuit includes a Signal Detect circuit which provides a PECL logic-high output upon detection of a usable input optical signal level. Signal Detect is a basic fiber failure indicator. This single-ended low-power PECL output is designed to drive a standard PECL input using a 10 k Ω load instead of the normal 50 Ω PECL load.

Receiver Signal Detect

As the input optical power is decreased, Signal Detect will switch from high to low (de-

Figure 2a. Laser Bias Monitor.

assert point) somewhere between sensitivity and the no light input level. As the input optical power is increased from very low levels, Signal Detect will switch back from low to high (assert point). The assert level will be at least 0.5 dB higher than the de-assert level.

Transceiver Specified for Wide Temperature Range Operation

The HFCT-5201 is specified for operation over normal commercial temperature range of 0° to +70°C (HFCT-5201B/D) or the extended temperature range of -40°C to +85°C (HFCT-5201A/C).

Other Members of HP 155 Mb/s Product Family

- HFCT-5205, 1300 nm single mode transceiver for links up to 15 km. The part is based on the 1 x 9 industry standard package and has an integral duplex SC connector receptacle
- XMT5370-155, 1300 nm laser-based transmitter in pigtailed package for 2 km and 15 km links with SMF cables
- XMT5170-155, 1300 nm laser-based transmitter in pigtailed package for 40 km links with SMF cables
- RCV1201D-155, receiver in pigtailed package for 2 km, 15 km and 40 km links with SMF cables.

Applications Information

Typical BER Performance of Receiver versus Input Optical Power Level

The HFCT-5201 transceiver can be operated at Bit-Error-Rate conditions other than the required $\text{BER} = 1 \times 10^{-10}$ of the ATM Forum 155.52 Mb/s Physical Layer Standard. The typical trade-off of BER versus Relative Input Optical Power is shown in Figure 3. The Relative Input Optical Power in dB is referenced to the Input Optical Power parameter value in the Receiver Optical Characteristics table. For BER conditions better than 1×10^{-10} , more input signal is needed (+dB).

Recommended Circuit Schematic

In order to ensure proper functionality of the HFCT-5201 a recommended circuit is provided in Figure 4. When designing the circuit interface, there are a few fundamental guidelines to follow. For example, in the Recommended Circuit Schematic figure the differential data lines should be treated as 50 ohm Microstrip or stripline transmission lines. This will help to minimize the parasitic inductance and

capacitance effects. Proper termination of the differential data signals will prevent reflections and ringing which would compromise the signal fidelity and generate unwanted electrical noise. Locate termination at the received signal end of the transmission line. The length of these lines should be kept short and of equal length. For the high speed signal lines, differential signals should be used, not single-ended signals, and these differential signals need to be loaded symmetrically to prevent unbalanced currents from flowing

which will cause distortion in the signal.

Maintain a solid, low inductance ground plane for returning signal currents to the power supply. Multi-layer plane printed circuit board is best for distribution of V_{CC} , returning ground currents, forming transmission lines and shielding. Also, it is important to suppress noise from influencing the fiber-optic transceiver performance, especially the receiver circuit. Proper power supply filtering of V_{CC} for this transceiver is accomplished by

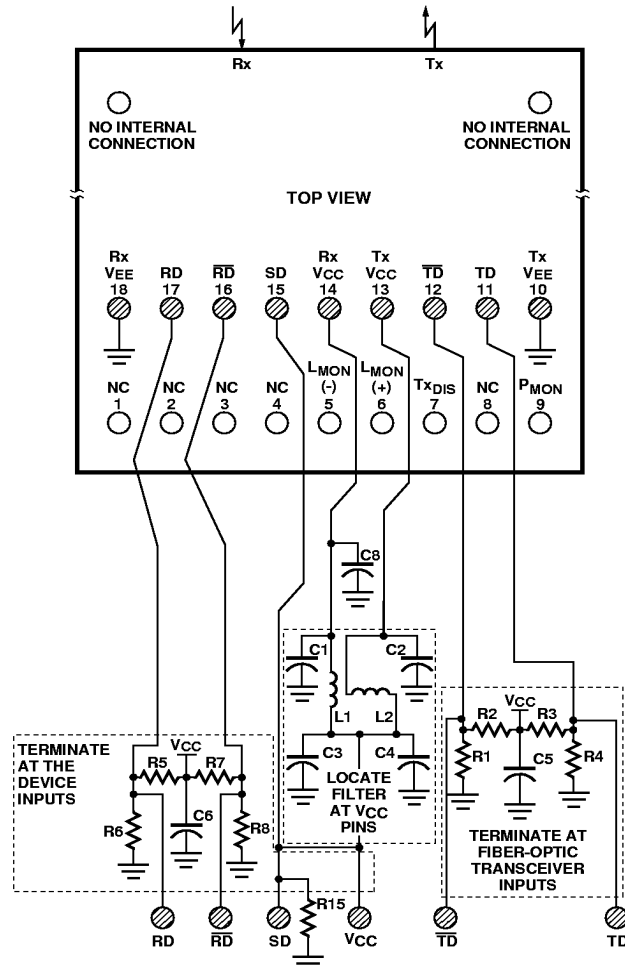

Figure 3. Relative Input Optical Power-dBm Avg.

NOTES:
THE SPLIT-LOAD TERMINATIONS FOR PECL SIGNALS NEED TO BE LOCATED AT THE INPUT OF DEVICES RECEIVING THOSE PECL SIGNALS.
R1 = R4 = R6 = R8 = 130 Ω .
R2 = R3 = R5 = R7 = 82 Ω .
R15 = 10 K.
C1 = C2 = C3 = C5 = C6 = 0.1 μF .
C4 = C8 = 10 μF .
L1 = L2 = 1 μH COIL.

Figure 4. Recommended Circuit Schematic.

using the recommended, separate filter circuits shown in Figure 4, the Recommended Circuit Schematic diagram for the transmitter and receiver sections. These filter circuits suppress V_{CC} noise of 50 mV peak-to-peak or less over a broad frequency range. This prevents receiver sensitivity degradation due to V_{CC} noise. It is recommended that surface-mount components be used. Use tantalum capacitors for the 10 μF capacitors and monolithic, ceramic bypass capacitors for the 0.1 μF capacitors. Also, it is recommended that a surface-mount coil inductor of 1 μH be used. Ferrite beads can be used to replace the coil inductors when using quieter V_{CC} supplies, but a coil inductor is recommended over a ferrite bead. Coils with a low, series dc resistance (<0.7 ohms) and high, self-resonating frequency are recommended. All power supply components need to be placed physically next to the V_{CC} pins of the receiver and transmitter. Use a good, uniform ground plane with a minimum number of holes to provide a low-inductance ground current return for the power supply currents.

In addition to these recommendations, Hewlett-Packard's Application Engineering staff is available for consulting on best layout practices with various vendors mux/demux, clock generator and clock recovery circuits. HP has participated in several reference design studies and is prepared to share the findings of these studies with interested customers. Contact your local HP sales representative to arrange for this service.

Evaluation Circuit Boards

Evaluation circuit boards implementing this recommended circuit design are available from Hewlett-Packard's Application Engineering staff. Contact your local HP sales representative to arrange for access to one if needed.

Operation in -5.2 V Designs

For applications that require -5.2 V dc power supply level for true ECL logic circuits, the HFCT-5201 transceiver can be operated with a $V_{CC} = 0$ V dc and a $V_{EE} = -5.2$ V dc. This transceiver is not specified with an operating, negative power supply voltage. The potential compromises that can occur with use of -5.2 V dc power are that the absolute voltage states for V_{OH} and V_{OL} will be changed slightly due to the 0.2 V difference in supply levels. Also, noise immunity may be compromised for the HFCT-5201 transceiver because the ground plane is now the V_{CC} supply point. The suggested power supply filter circuit shown in Figure 4, Recommended Circuit Schematic, should be located in the V_{EE} paths at the transceiver supply pins. Direct coupling of the differential data signals can be done between the HFCT-5201 transceiver and the standard ECL circuits. For guaranteed -5.2 V dc operation, contact your local Hewlett-Packard Field Sales Engineer for assistance.

Recommended Solder and Wash Process

The HFCT-5201 is compatible with industry standard wave or hand solder processes.

HFCT-5201 Process Plug

The HFCT-5201 transceiver is supplied with a process plug for protection of the optical ports with the Duplex SC connector receptacle. This process plug prevents contamination during wave solder and aqueous rinse as well as during handling, shipping or storage. It is made of high-temperature, molded, sealing material that will withstand $+80^{\circ}\text{C}$ and a rinse pressure of 50 lb/in².

Recommended Solder Fluxes and Cleaning/Degreasing Chemicals

Solder fluxes used with the HFCT-5201 fiber-optic transceiver should be water-soluble, organic solder fluxes. Some recommended solder fluxes are Lonco 3355-11 from London Chemical West, Inc. of Burbank, CA, and 100 Flux from Alpha-metals of Jersey City, N.J.

Recommended cleaning and degreasing chemicals for the HFCT-5201 are alcohols (methyl, isopropyl, isobutyl), aliphatics (hexane, heptane) and other chemicals, such as soap solution or naphtha. Do not use partially halogenated hydro-carbons for cleaning/degreasing. Examples of chemicals to avoid are 1.1.1. trichloroethane, ketones (such as MEK), acetone, chloroform, ethyl acetate, methylene dichloride, phenol, methylene chloride or N-methylpyrrolidone.

Regulatory Compliance

The HFCT-5201 is intended to enable commercial system designers to develop equipment that complies with the various regulations governing certification of Information Technology

Equipment. See the Regulatory Compliance Table 1 for details. Additional information is available from your Hewlett-Packard sales representative.

Electrostatic Discharge (ESD)

There are two design cases in which immunity to ESD damage is important.

The first case is during handling of the transceiver prior to mounting it on the circuit board. It is important to use normal ESD handling precautions for ESD sensitive devices. These precau-

tions include using grounded wrist straps, work benches, and floor mats in ESD controlled areas.

The second case to consider is static discharges to the exterior of the equipment chassis containing the transceiver parts. To the extent that the duplex SC connector is exposed to the outside of the equipment chassis it may be subject to whatever ESD system level test criteria that the equipment is intended to meet.

Electromagnetic Interference (EMI)

Most equipment designs utilizing these high-speed transceivers from Hewlett-Packard will be required to meet the requirements of FCC in the United States, CENELEC EN55022 (CISPR 22) in Europe and VCCI in Japan.

The HFCT-5201 has been characterized without a chassis enclosure to demonstrate the robustness of the part's integral shielding. Performance of a system containing these transceivers within a well

designed chassis is expected to be better than the results of these tests with no chassis enclosure.

Immunity

Equipment utilizing these HFCT-5201 transceivers will be subject to radio-frequency electromagnetic fields in some environments. These transceivers, with their integral shields,

have been characterized without the benefit of a normal equipment chassis enclosure and the results are reported below.

Performance of a system containing these transceivers within a well-designed chassis is expected to be better than the results of these tests without a chassis enclosure.

Table 1. Regulatory Compliance—Typical Performance

| Feature | Test Method | Performance |
|---|---|---|
| Electrostatic Discharge (ESD to the Electrical Pins) | MIL-STD-883C Method 3015.4 | Class 1 (> 1000 V) |
| Electrostatic Discharge (ESD) to the Duplex SC Receptacle | Variation of IEC 801-2 | Products of this design typically withstand at least 25 kV without damage when the Duplex SC Connector Receptacle is contacted by a Human Body Model probe. |
| Electromagnetic Interference (EMI) | FCC Class B CENELEC EN55022 Class B (CISPR 22B) VCCI Class 2 | Typically provide 11 dB margin to FCC Class B when tested at a certified test range with the transceiver mounted to a circuit card without a chassis enclosure at frequencies up to 1 GHz. Margins above 1 GHz are dependent on customer board and chassis designs. |
| Immunity | Variation of IEC 801-3 | Typically show no measurable effect from a 10 V/m field swept from 27 MHz to 1 GHz applied to the transceiver when mounted to a circuit card without a chassis enclosure. |
| Eye Safety | IEC 825 | License Pending. |
| | CDRH Class 1 | License Pending. |

Notes:

1. Output power is power coupled into a single mode fiber.
2. The power supply current varies with temperature. Maximum current is specified at $V_{CC} = \text{Maximum}$ at maximum temperature (not including terminations) and end of life.
3. Common mode signal 2.5 V nominal.
4. Minimum sensitivity and saturation levels for a $2^{23}-1$ PRBS with 72 ones and 72 zeros inserted. (ITU recommendation G.958).
5. The current excludes the output load current.

Table 2. Pin Out Table

| Pin | Symbol | Functional Description |
|----------------|----------------------|---|
| Mounting Studs | | The mounting studs are provided for transceiver mechanical attachment to the circuit board. They are embedded in the nonconductive plastic housing and are not connected to the transceiver internal circuit. They should be soldered into plated-through holes on the printed circuit board. |
| 1 | N/C | |
| 2 | N/C | |
| 3 | N/C | |
| 4 | N/C | |
| 5 | L _{MON} (-) | Laser Bias Monitor (-) This analog current is monitored by measuring the voltage drop across a 10 ohm resistor placed between high impedance resistors connected to pins 5 and 6 internal to the transceiver. |
| 6 | L _{MON} (+) | Laser Bias Monitor (+) This analog current is monitored by measuring the voltage drop across a 10 ohm resistor placed between high impedance resistors connected to pins 5 and 6 internal to the transceiver. |
| 7 | T _{XDIS} | Transmitter Disable Transmitter Output Disabled: $V_{CCT} - 1.5 \text{ V} \leq V_7 \leq V_{CCT}$. Transmitter Output Uncertain: $V_{CCT} - 4.2 \text{ V} \leq V_7 \leq V_{CCT} - 1.5 \text{ V}$. Transmitter Output Enabled: $V_{EET} \leq V_7 \leq V_{CCT} - 4.2 \text{ V}$ or open circuit. |
| 8 | N/C | |
| 9 | P _{MON} | Power Monitor The analog voltage measured at this high impedance output provides an indication of whether the optical power output of the Laser Diode is operating within the normal specified power output range per the following relationships: High Light Indication: $V_9 \geq V_{EET} + 1.7 \text{ V}$. Normal Operation: $V_9 \approx V_{EET} + 1.2 \text{ V}$. Low Light Indication: $V_9 \leq V_{EET} + 0.7 \text{ V}$. |
| 10 | V _{EET} | Transmitter Signal Ground Directly connect this pin to the transmitter signal ground plane. |
| 11 | TD+ | Transmitter Data In Terminate this high-speed, differential Transmitter Data input with standard PECL techniques at the transmitter input pin. |
| 12 | TD- | Transmitter Data In Bar Terminate this high-speed, differential Transmitter Data input with standard PECL techniques at the transmitter input pin. |
| 13 | V _{CCT} | Transmitter Power Supply Provide +5 V dc via the recommended transmitter power supply filter circuit. Locate the power supply filter circuit as close as possible to the V _{CCT} pin. |
| 14 | V _{CCR} | Receiver Power Supply Provide +5 V dc via the recommended receiver power supply filter circuit. Locate the power supply filter circuit as close as possible to the V _{CCR} pin. |
