

PS21455-E**INTEGRATED POWER FUNCTIONS**

4th generation (planar) IGBT inverter bridge for 3 phase DC-to-AC power conversion.

INTEGRATED DRIVE, PROTECTION AND SYSTEM CONTROL FUNCTIONS

- For upper-leg IGBTs : Drive circuit, High voltage isolated high-speed level shifting, Control circuit under-voltage (UV) protection.
Note : Bootstrap supply scheme can be applied.
- For lower-leg IGBTs : Drive circuit, Control circuit under-voltage protection (UV), Short circuit protection (SC).
- Fault signaling : Corresponding to a SC fault (Low-side IGBT) or a UV fault (Low-side supply).
- Input interface : 5V line CMOS/TTL compatible, Schmitt Trigger receiver circuit.

APPLICATION

AC100V~200V three-phase inverter drive for small power motor control.

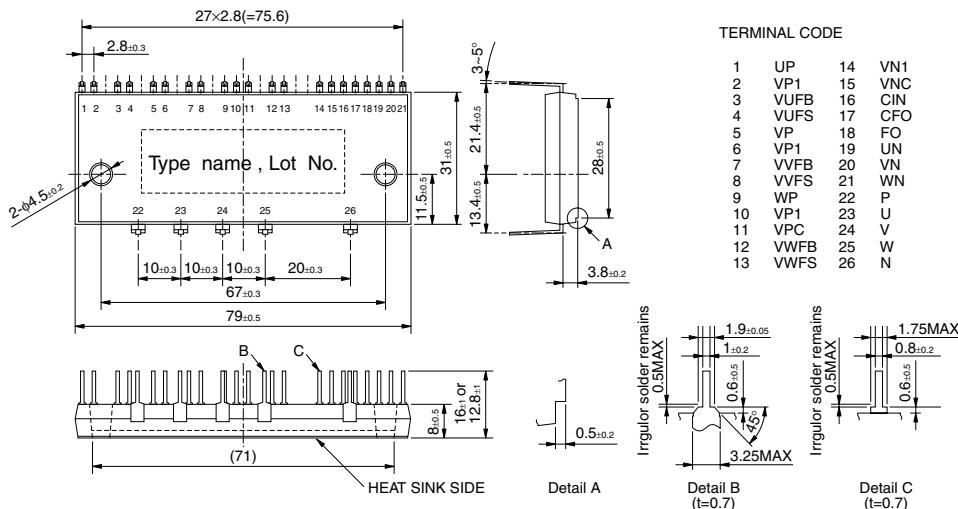

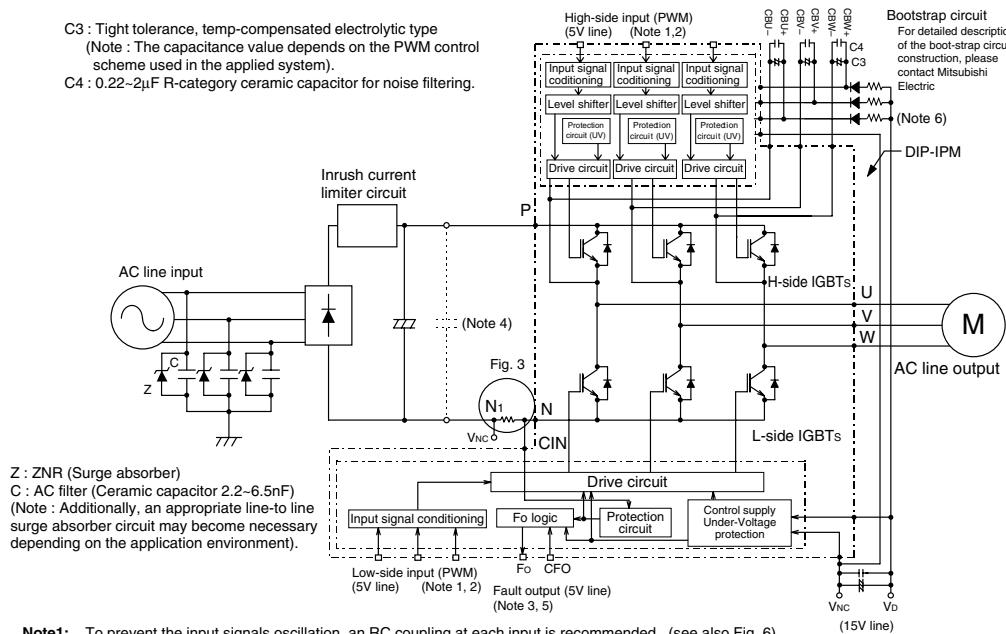

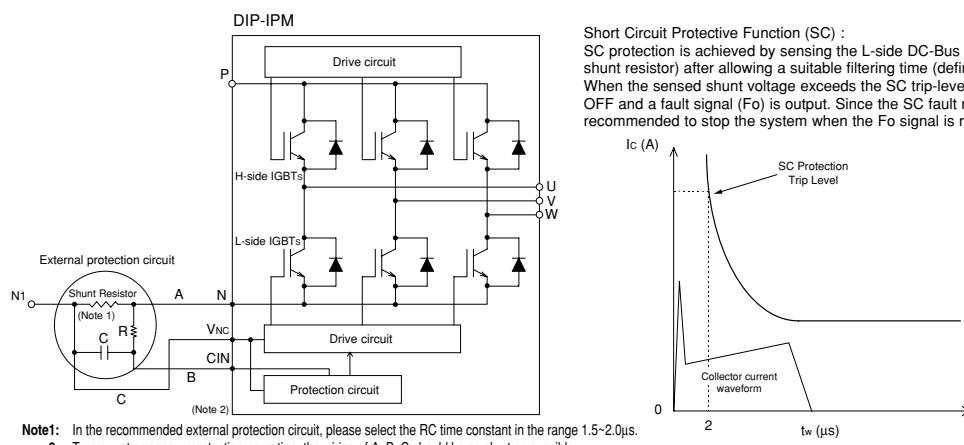

Fig. 2 INTERNAL FUNCTIONS BLOCK DIAGRAM (TYPICAL APPLICATION EXAMPLE)

- Note1:** To prevent the input signals oscillation, an RC coupling at each input is recommended. (see also Fig. 6)
- 2:** By virtue of integrating an application specific type HVIC inside the module, direct coupling to CPU terminals without any opto-coupler or transformer isolation is possible. (see also Fig. 6)
- 3:** This output is open collector type. The signal line should be pulled up to the positive side of the 5V power supply with approximately 5.1kΩ resistance. (see also Fig. 6)
- 4:** The wiring between the power DC link capacitor and the P/N1 terminals should be as short as possible to protect the DIP-IPM against catastrophic high surge voltages. For extra precaution, a small film type snubber capacitor (0.1~0.22μF, high voltage type) is recommended to be mounted close to these P and N1 DC power input pins.
- 5:** Fo output pulse width should be decided by putting external capacitor between CFO and VNC terminals. (Example : CFO=22nF → t_{ro}=1.8ms (Typ.))
- 6:** High voltage (600V or more) and fast recovery type (less than 100ns) diodes should be used in the bootstrap circuit.

Fig. 3 EXTERNAL PART OF THE DIP-IPM PROTECTION CIRCUIT

Short Circuit Protective Function (SC) :
SC protection is achieved by sensing the L-side DC-Bus current (through the external shunt resistor) after allowing a suitable filtering time (defined by the RC circuit). When the sensed shunt voltage exceeds the SC trip-level, all the L-side IGBTs are turned OFF and a fault signal (Fo) is output. Since the SC fault may be repetitive, it is recommended to stop the system when the Fo signal is received and check the fault.

MAXIMUM RATINGS ($T_j = 25^\circ\text{C}$, unless otherwise noted)**INVERTER PART**

Symbol	Parameter	Condition	Ratings	Unit
Vcc	Supply voltage	Applied between P-N	450	V
VCC(surge)	Supply voltage (surge)	Applied between P-N	500	V
Vces	Collector-emitter voltage		600	V
$\pm I_c$	Each IGBT collector current	$T_c = 25^\circ\text{C}$	20	A
$\pm I_{CP}$	Each IGBT collector current (peak)	$T_c = 25^\circ\text{C}$, instantaneous value (pulse)	40	A
Pc	Collector dissipation	$T_c = 25^\circ\text{C}$, per 1 chip	56	W
Tj	Junction temperature	(Note 1)	-20~+150	$^\circ\text{C}$

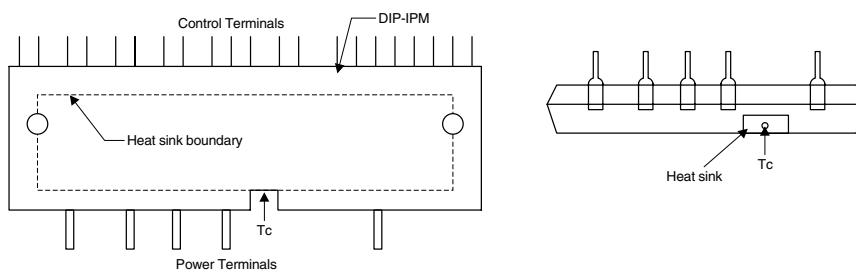

Note 1 : The maximum junction temperature rating of the power chips integrated within the DIP-IPM is 150°C (@ $T_c \leq 100^\circ\text{C}$) however, to ensure safe operation of the DIP-IPM, the average junction temperature should be limited to $T_{j(\text{ave})} \leq 125^\circ\text{C}$ (@ $T_c \leq 100^\circ\text{C}$).

CONTROL (PROTECTION) PART

**[B] Under-Voltage Protection (N-side, UVp)**

- a1. Normal operation : IGBT ON and carrying current.
- a2. Under voltage trip (UV_{Dt}).
- a3. IGBT OFF in spite of control input condition.
- a4. Fo timer operation starts.
- a5. Under voltage reset (UV_{Dr}).
- a6. Normal operation : IGBT ON and carrying current.

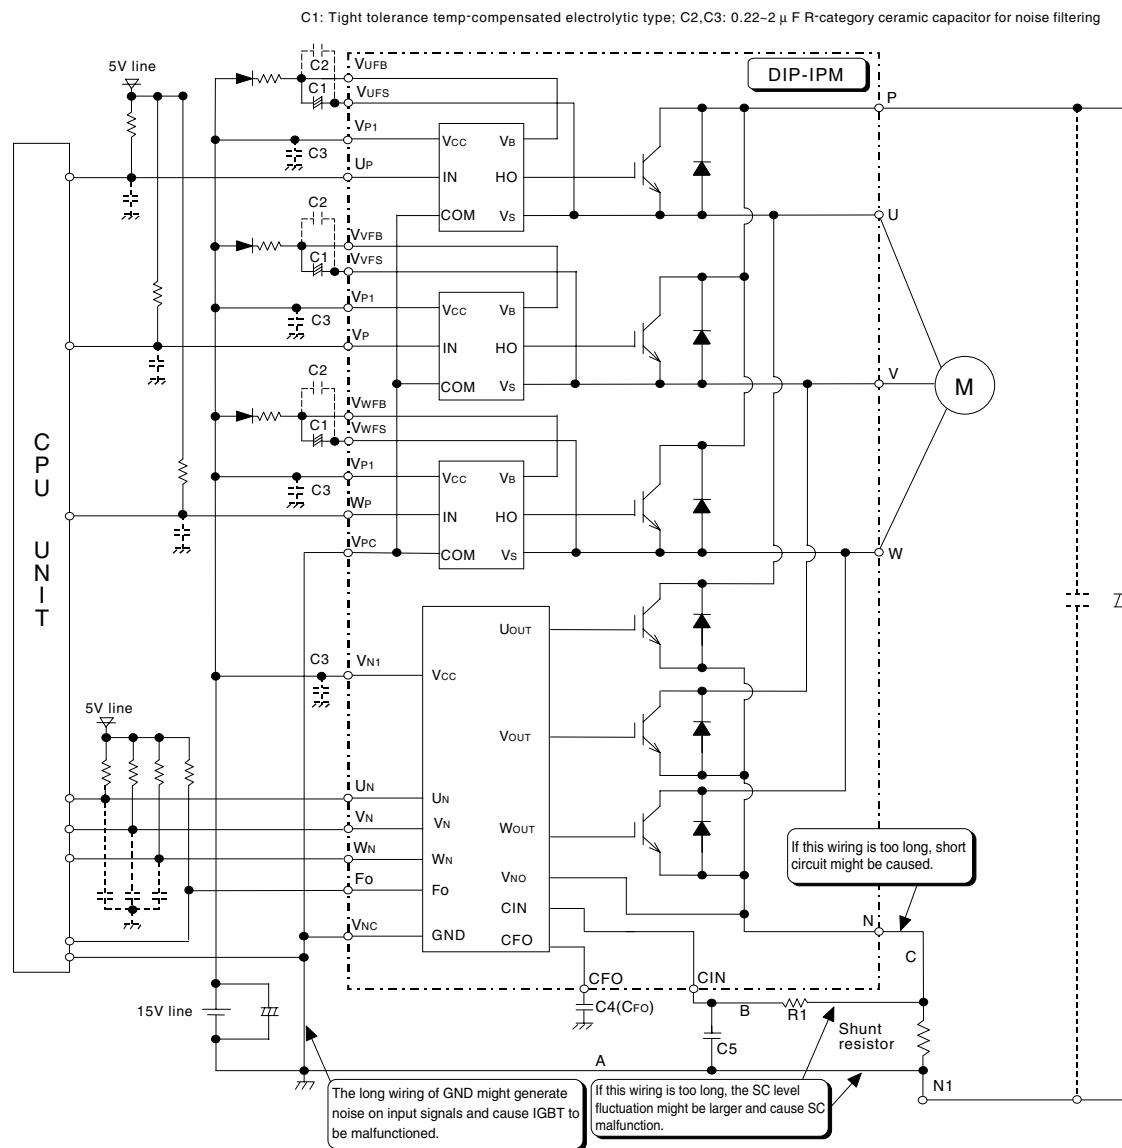

[C] Under-Voltage Protection (P-side, UVDB)

- a1. Control supply voltage rises : After the voltage level reaches UV_{DBr} , the circuits start to operate when the next input is applied.
 a2. Normal operation : IGBT ON and carrying current.
 a3. Under voltage trip (UV_{DBt}).
 a4. IGBT OFF in spite of control input condition, but there is no Fo signal output.
 a5. Under-voltage reset (UV_{DBr}).
 a6. Normal operation : IGBT ON and carrying current.

**Fig. 6 RECOMMENDED CPU I/O INTERFACE CIRCUIT**

Note : RC coupling at each input (parts shown dotted) may change depending on the PWM control scheme used in the application and on the wiring impedances of the application's printed circuit board.

Fig. 7 TYPICAL DIP-IPM APPLICATION CIRCUIT EXAMPLE

- Note 1:** To prevent the input signals oscillation, an RC coupling at each input is recommended, and the wiring of each input should be as short as possible. (Less than 2cm)
- 2:** By virtue of integrating an application specific type HVIC inside the module, direct coupling to CPU terminals without any opto-coupler or transformer isolation is possible.
- 3:** Fo output is open collector type. This signal line should be pulled up to the positive side of the 5V power supply with approximately 5.1k Ω resistance.
- 4:** Fo output pulse width should be decided by connecting an external capacitor between CFO and VNC terminals (CFO). (Example : CFO = 22 nF \rightarrow tFO = 1.8 ms (typ.))
- 5:** Each input signal line should be pulled up to the 5V power supply with approximately 4.7k Ω resistance (other RC coupling circuits at each input may be needed depending on the PWM control scheme used and on the wiring impedances of the system's printed circuit board). Approximately a 0.22~2 μ F by-pass capacitor should be used across each power supply connection terminals.
- 6:** To prevent errors of the protection function, the wiring of A, B, C should be as short as possible.
- 7:** In the recommended protection circuit, please select the R1C5 time constant in the range 1.5~2 μ s.
- 8:** Each capacitor should be put as nearby the pins of the DIP-IPM as possible.
- 9:** To prevent surge destruction, the wiring between the smoothing capacitor and the P&N1 pins should be as short as possible. Approximately a 0.1~0.22 μ F snubber capacitor between the P&N1 pins is recommended.
