1. SCOPE

1.1 Scope. This drawing documents two product assurance class levels consisting of high reliability (device classes Q and M) and space application (device class V). A choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). When available, a choice of Radiation Hardness Assurance (RHA) levels are reflected in the PIN.

1.2 PIN. The PIN is as shown in the following example:

1.2.1 RHA designator. Device classes Q and V RHA marked devices meet the MIL-PRF-38535 specified RHA levels and are marked with the appropriate RHA designator. Device class M RHA marked devices meet the MIL-PRF-38535, appendix A specified RHA levels and are marked with the appropriate RHA designator. A dash (-) indicates a non-RHA device.

1.2.2 Device type(s). The device type(s) identify the circuit function as follows:

Device type	Generic number	Circuit function
01	21062L	3.3-V digital signal processor, 32-bit, 2 Mbit SRAM
02	21060L	3.3-V digital signal processor, 32-bit, 4 Mbit SRAM

1.2.3 Device class designator. The device class designator is a single letter identifying the product assurance level as follows:

Device class	Device requirements documentation
M	Vendor self-certification to the requirements for MIL-STD-883 compliant, non-JAN class level B microcircuits in accordance with MIL-PRF-38535, appendix A
Q or V	Certification and qualification to MIL-PRF-38535

1.2.4 Case outline(s). The case outline(s) are as designated in MIL-STD-1835 and as follows:

Outline letter	Descriptive designator	Terminals	Package style
X	See figure 1	240	Gull wing flatpack cavity down heat sink
Y	See figure 1	240	Gull wing flatpack cavity up heat sink
T	See figure 1	240	Flatpack with non-conductive tie-bar cavity down heat sink
U	See figure 1	240	Flatpack with non-conductive tie-bar cavity up heat sink

1.2.5 Lead finish. The lead finish is as specified in MIL-PRF-38535 for device classes Q and V or MIL-PRF-38535, appendix A for device class M.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-96744
		REVISION LEVEL	SHEET 2

1.3 Absolute maximum ratings. 1/

Supply voltage range (V_{DD}).....	-0.3 V dc to +4.6 V dc
Input voltage range (V_{IN}).....	-0.3 V dc to $V_{DD} + 0.3$ V dc
Output voltage range (V_{OUT})	-0.3 V dc to $V_{DD} + 0.3$ V dc
Load capacitance	200 pF
Lead temperature (soldering, 5 seconds).....	+280°C
Storage temperature range (T_{STG})	-65°C to +150°C
Maximum power dissipation (P_D).....	5 W
Thermal resistance junction-to-case (Θ_{JC}):	
Cases X,Y, T, and U	0.24°C/W

1.4 Recommended operating conditions.

Supply voltage range (V_{DD}).....	+3.13 V dc to +3.47 V dc
Case operating temperature range (T_C)	-55°C to +125°C

1.5 Digital logic testing for device classes Q and V.

Fault coverage measurement of manufacturing logic tests (MIL-STD-883, test method 5012)	XX percent 2/

2. APPLICABLE DOCUMENTS

2.1 Government specification, standards, and handbooks. The following specification, standards, and handbooks form a part of this drawing to the extent specified herein. Unless otherwise specified, the issues of these documents are those listed in the issue of the Department of Defense Index of Specifications and Standards (DoDISS) and supplement thereto, cited in the solicitation.

SPECIFICATION

DEPARTMENT OF DEFENSE

MIL-PRF-38535 - Integrated Circuits, Manufacturing, General Specification for.

STANDARDS

DEPARTMENT OF DEFENSE

MIL-STD-883 - Test Methods and Procedures for Microelectronics.
MIL-STD-973 - Configuration Management.
MIL-STD-1835 - Interface Standard For Microcircuit Case Outlines.

HANDBOOKS

DEPARTMENT OF DEFENSE

MIL-HDBK-103 - List of Standard Microcircuit Drawings (SMD's).
MIL-HDBK-780 - Standard Microcircuit Drawings.

(Unless otherwise indicated, copies of the specification, standards, and handbooks are available from the Standardization Document Order Desk, 700 Robbins Avenue, Building 4D, Philadelphia, PA 19111-5094.)

- 1/ Stress above the absolute maximum rating may cause permanent damage to the device. Extended operation at the maximum levels may degrade performance and affect reliability.
2/ Values are not available.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-96744
		REVISION LEVEL	SHEET 3

2.2 Non-Government publications. The following document(s) form a part of this document to the extent specified herein. Unless otherwise specified, the issues of the documents which are DOD adopted are those listed in the issue of the DODISS cited in the solicitation. Unless otherwise specified, the issues of documents not listed in the DODISS are the issues of the documents cited in the solicitation.

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE Standard 1149.1 - IEEE Standard Test Access Port and Boundary Scan Architecture.

(Applications for copies should be addressed to the Institute of Electrical and Electronics Engineers, 445 Hoes Lane, Piscataway, NJ 08854-4150.)

(Non-Government standards and other publications are normally available from the organizations that prepare or distribute the documents. These documents may also be available in or through libraries or other informational services.)

2.3 Order of precedence. In the event of a conflict between the text of this drawing and the references cited herein, the text of this drawing takes precedence. Nothing in this document, however, supersedes applicable laws and regulations unless a specific exemption has been obtained.

3. REQUIREMENTS

3.1 Item requirements. The individual item requirements for device classes Q and V shall be in accordance with MIL-PRF-38535 and as specified herein or as modified in the device manufacturer's Quality Management (QM) plan. The modification in the QM plan shall not affect the form, fit, or function as described herein. The individual item requirements for device class M shall be in accordance with MIL-PRF-38535, appendix A for non-JAN class level B devices and as specified herein.

3.2 Design, construction, and physical dimensions. The design, construction, and physical dimensions shall be as specified in MIL-PRF-38535 and herein for device classes Q and V or MIL-PRF-38535, appendix A and herein for device class M.

3.2.1 Case outlines. The case outlines shall be in accordance with 1.2.4 and figure 1 herein.

3.2.2 Terminal connections. The terminal connections shall be as specified on figure 2.

3.2.3 Block diagram. The block diagram shall be as specified on figure 3.

3.2.4 Boundary scan instruction codes. The boundary scan instruction codes shall be as specified on figure 4.

3.2.5 Timing waveforms. The timing waveforms shall be as specified on figure 5.

3.2.6 Radiation exposure circuit. The radiation exposure circuit shall be as specified when available.

3.3 Electrical performance characteristics and postirradiation parameter limits. Unless otherwise specified herein, the electrical performance characteristics and postirradiation parameter limits are as specified in table I and shall apply over the full case operating temperature range.

3.4 Electrical test requirements. The electrical test requirements shall be the subgroups specified in table II. The electrical tests for each subgroup are defined in table I.

3.5 Marking. The part shall be marked with the PIN listed in 1.2 herein. In addition, the manufacturer's PIN may also be marked as listed in MIL-HDBK-103. For packages where marking of the entire SMD PIN number is not feasible due to space limitations, the manufacturer has the option of not marking the "5962-" on the device. For RHA product using this option, the RHA designator shall still be marked. Marking for device classes Q and V shall be in accordance with MIL-PRF-38535. Marking for device class M shall be in accordance with MIL-PRF-38535, appendix A.

3.5.1 Certification/compliance mark. The certification mark for device classes Q and V shall be a "QML" or "Q" as required in MIL-PRF-38535. The compliance mark for device class M shall be a "C" as required in MIL-PRF-38535, appendix A.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-96744
		REVISION LEVEL	SHEET 4

3.6 Certificate of compliance. For device classes Q and V, a certificate of compliance shall be required from a QML-38535 listed manufacturer in order to supply to the requirements of this drawing (see 6.6.1 herein). For device class M, a certificate of compliance shall be required from a manufacturer in order to be listed as an approved source of supply in MIL-HDBK-103 (see 6.6.2 herein). The certificate of compliance submitted to DSCC-VA prior to listing as an approved source of supply for this drawing shall affirm that the manufacturer's product meets, for device classes Q and V, the requirements of MIL-PRF-38535 and herein or for device class M, the requirements of MIL-PRF-38535, appendix A and herein.

3.7 Certificate of conformance. A certificate of conformance as required for device classes Q and V in MIL-PRF-38535 or for device class M in MIL-PRF-38535, appendix A shall be provided with each lot of microcircuits delivered to this drawing.

3.8 Notification of change for device class M. For device class M, notification to DSCC-VA of change of product (see 6.2 herein) involving devices acquired to this drawing is required for any change as defined in MIL-STD-973.

3.9 Verification and review for device class M. For device class M, DSCC, DSCC's agent, and the acquiring activity retain the option to review the manufacturer's facility and applicable required documentation. Offshore documentation shall be made available onshore at the option of the reviewer.

3.10 Microcircuit group assignment for device class M. Device class M devices covered by this drawing shall be in microcircuit group number 132 (see MIL-PRF-38535, appendix A).

3.11 IEEE 1149.1 compliance. These devices shall be compliant to IEEE 1149.1.

4. QUALITY ASSURANCE PROVISIONS

4.1 Sampling and inspection. For device classes Q and V, sampling and inspection procedures shall be in accordance with MIL-PRF-38535 or as modified in the device manufacturer's Quality Management (QM) plan. The modification in the QM plan shall not affect the form, fit, or function as described herein. For device class M, sampling and inspection procedures shall be in accordance with MIL-PRF-38535, appendix A.

4.2 Screening. For device classes Q and V, screening shall be in accordance with MIL-PRF-38535, and shall be conducted on all devices prior to qualification and technology conformance inspection. For device class M, screening shall be in accordance with method 5004 of MIL-STD-883, and shall be conducted on all devices prior to quality conformance inspection.

4.2.1 Additional criteria for device class M.

a. Burn-in test, method 1015 of MIL-STD-883.

(1) Test condition A, B, C, or D. The test circuit shall be maintained by the manufacturer under document revision level control and shall be made available to the preparing or acquiring activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in test method 1015.

(2) $T_A = +125^{\circ}\text{C}$, minimum.

b. Interim and final electrical test parameters shall be as specified in table II herein.

TABLE I. Electrical performance characteristics - Continued.

- 4/ Applies to output and bidirectional pins: $\overline{\text{DATA}}_{47-0}$, $\overline{\text{ADDR}}_{31-0}$, $\overline{\text{MS3-0}}$, $\overline{\text{RD}}$, $\overline{\text{WR}}$, $\overline{\text{PAGE}}$, $\overline{\text{ADRCCLK}}$, $\overline{\text{SW}}$, $\overline{\text{ACK}}$, $\overline{\text{FLAG}}_{3-0}$, $\overline{\text{TIMEXP}}$, $\overline{\text{HBG}}$, $\overline{\text{REDY}}$, $\overline{\text{DMAG1}}$, $\overline{\text{DMAG2}}$, $\overline{\text{BR6-1}}$, $\overline{\text{CPA}}$, $\overline{\text{DT0}}$, $\overline{\text{DT1}}$, $\overline{\text{TCLK0}}$, $\overline{\text{TCLK1}}$, $\overline{\text{RCLK0}}$, $\overline{\text{RCLK1}}$, $\overline{\text{TFS0}}$, $\overline{\text{TFS1}}$, $\overline{\text{RFS0}}$, $\overline{\text{RFS1}}$, $\overline{\text{LxDAT}}_{3-0}$, $\overline{\text{LxCLK}}$, $\overline{\text{LxACK}}$, $\overline{\text{BMS}}$, $\overline{\text{TDO}}$, $\overline{\text{EMU}}$, $\overline{\text{ICSA}}$.
- 5/ Although specified for TTL outputs, all device outputs are CMOS-compatible and will drive to V_{DD} and GND assuming no dc loads.
- 6/ Applies to input pins: $\overline{\text{SBTS}}$, $\overline{\text{IRQ2-0}}$, $\overline{\text{HBR}}$, $\overline{\text{CS}}$, $\overline{\text{DMAR1}}$, $\overline{\text{DMAR2}}$, $\overline{\text{ID2-0}}$, $\overline{\text{RPBA}}$, $\overline{\text{EBOOT}}$, $\overline{\text{LBOOT}}$, $\overline{\text{CLKIN}}$, $\overline{\text{RESET}}$, $\overline{\text{TCK}}$.
- 7/ Applies to input pins with internal pullups: $\overline{\text{DR0}}$, $\overline{\text{DR1}}$, $\overline{\text{TRST}}$, $\overline{\text{TMS}}$, $\overline{\text{TDI}}$.
- 8/ Applies to tristatable pins: $\overline{\text{DATA}}_{47-0}$, $\overline{\text{ADDR}}_{31-0}$, $\overline{\text{MS3-0}}$, $\overline{\text{RD}}$, $\overline{\text{WR}}$, $\overline{\text{PAGE}}$, $\overline{\text{ADRCCLK}}$, $\overline{\text{SW}}$, $\overline{\text{ACK}}$, $\overline{\text{FLAG}}_{3-0}$, $\overline{\text{REDY}}$, $\overline{\text{HBG}}$, $\overline{\text{DMAG1}}$, $\overline{\text{DMAG2}}$, $\overline{\text{BMS}}$, $\overline{\text{BRG}}_{6-1}$, $\overline{\text{TFS}}_x$, $\overline{\text{RFS}}_x$, $\overline{\text{TDO}}$, $\overline{\text{EMU}}$ (Note that $\overline{\text{ACK}}$ is pulled up internally with 2 K Ω during reset in a multiprocessor system, when $\overline{\text{ID2-0}} = 001$ and another DSP is not requesting bus mastership).
- 9/ Applies to tristatable pins with internal pullups: $\overline{\text{DT0}}$, $\overline{\text{DT1}}$, $\overline{\text{TCLK0}}$, $\overline{\text{TCLK1}}$, $\overline{\text{RCLK0}}$, $\overline{\text{RCLK1}}$.
- 10/ Applies to $\overline{\text{CPA}}$ pin.
- 11/ Applies to $\overline{\text{ACK}}$ pin when pulled up. (Note that $\overline{\text{ACK}}$ is pulled up internally with 2 K Ω during reset in a multiprocessor system, when $\overline{\text{ID2-0}} = 001$ and another DSP is not requesting bus mastership).
- 12/ Applies to $\overline{\text{ACK}}$ pin when keeper latch enabled.
- 13/ Applies to tristatable pins with internal pull downs: $\overline{\text{LxDAT}}_{3-0}$, $\overline{\text{LxCLK}}$, $\overline{\text{LxACK}}$.
- 14/ Applies to V_{DD} pins. Total power dissipation has two components, one due to internal circuitry and one due to the switching of external output drivers: $P_{\text{TOTAL}} = P_{\text{INT}} + P_{\text{EXT}}$. Internal power dissipation is $P_{\text{INT}} = I_{\text{DDIN}} \times V_{DD}$. The external component of total power dissipation is caused by the switching of output pins, and depends on: the number of pins that switch each cycle (O), the maximum frequency at which they can switch (f), the load capacitance per pin (C), the output voltage swing (V_{DD}): $P_{\text{EXT}} = O \times C \times V_{DD}^2 \times f$. Address and data pins can switch at $f = 1/(2t_{CK})$. $\overline{\text{WR}}$ can switch at $1/t_{CK}$. $\overline{\text{MS}}_x$ pins switch at $1/(2t_{CK})$.
- 15/ Conditions of operation: Executing radix-2 FFT butterfly with instruction in cache, one data operand fetched from each internal memory.
- 16/ Applies to V_{DD} pins. Idle denotes device state during execution of IDLE instruction.
- 17/ Applies to all signal pins.
- 18/ Guaranteed but not tested. Timing characteristics are guaranteed by characterization at -55°C, 25°C, and 125°C of each performance parameter over the range of supply voltage (V_{DD}). Characterization is performed using devices whose transistor characteristics are deliberately skewed in processing to simulate maximum expected performance variation due to process variation. Selected timing characteristics are routinely tested in production devices.
- 19/ Applies after the powerup sequence is complete. At powerup, the processor's internal phase-locked loop requires no more than 2000 CLKIN cycles while $\overline{\text{RESET}}$ is low, assuming stable V_{DD} and CLKIN (not including startup time of external clock oscillator).
- 20/ Only required if multiple device must come out of reset synchronous to CLKIN with program counter (PC) equal (i.e., for a SIMD system). Not required for multiple devices communicating over the shared bus (through the external port), because the bus arbitration logic synchronizes itself automatically after reset.
- 21/ Only required for $\overline{\text{IRQ}}_x$ recognition in the following cycle.
- 22/ Applies only if t_{SIR} and t_{HIR} requirements are not met.
- 23/ Flag inputs meeting these setup and hold times will affect conditional instructions in the following instruction cycle.
- 24/ Data Delay/Setup: User must meet t_{DAD} or t_{DRLD} or synchronous spec t_{SSDATI} .
- 25/ The falling edge of $\overline{\text{MS}}_x$, $\overline{\text{SW}}$, $\overline{\text{BMS}}$ is referenced.
- 26/ Data Hold: User must meet t_{HDA} or t_{HDRH} or synchronous spec t_{HSDATI} .
- 27/ To determine the data output hold time in a particular system, first calculate $t_{\text{DECAY}} = C_{\text{LOAD}} \times \Delta V / I_{\text{LOAD}}$. Choose ΔV to be the difference between the microcontroller's output voltage and the input threshold of the device requiring the data hold time. A typical ΔV will be 0.4 V. C_{LOAD} is the total bus capacitance (per data line), and I_{LOAD} is the total leakage or three-state current (per data line). The hold time will be t_{DECAY} plus the minimum disable time.
- 28/ ACK Delay/Setup: User must meet t_{DAAK} or t_{DSAK} or synchronous specification t_{SACKC} for deassertion of ACK (low), all three specifications must be met for assertion of ACK (high).

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-96744
		REVISION LEVEL A	SHEET 19

TABLE I. Electrical performance characteristics - Continued.

- 29/ $t_{SRWL}(min) = 9.5+5DT/16$ when multiprocessor memory space wait state (MMSWS bit in WAIT register) is disabled; when MMSWS is enabled, $t_{SRWL}(min) = 4+DT/8$.
- 30/ t_{DACKAD} is true only if the address and $\overline{SW}$ inputs have setup times (before CLKIN) greater than $10+DT/8$ and less than $19+3DT/4$. If the address and $\overline{SW}$ inputs have setup times greater than $19+3DT/4$, then ACK is valid $14+DT/4$ (max) after CLKIN. A slave that sees an address with an M field match will respond with ACK regardless of the state of MMSWS or strobes. A slave will three-state ACK every cycle with t_{ACKTR} .
- 31/ For first asynchronous access after $\overline{HBR}$ and $\overline{CS}$ asserted, $ADDR_{31-0}$ must be a non-MMS value $1/2 t_{CK}$ before $\overline{RD}$ or $\overline{WR}$ goes low or by $t_{HBGRCSV}$ after $\overline{HBG}$ goes low. This is easily accomplished by driving an upper address signal high when $\overline{HBG}$ is asserted.
- 32/ Only required for recognition in the current cycle.
- 33/ CPA assertion must meet the setup to CLKIN; deassertion does not need to meet the setup to CLKIN.
- 34/ (o/d) = open drain, (a/d) = active drive.
- 35/ Not required if $\overline{RD}$ and Address are valid $t_{HBGRCSV}$ after $\overline{HBG}$ goes low.
- 36/ Strokes = $\overline{RD}$, $\overline{WR}$, $\overline{SW}$, PAGE, $\overline{DMAG}$.
- 37/ In addition to bus master transition cycles, these specs also apply to bus master and bus slave synchronous read/write.
- 38/ Memory interface = address, $\overline{RD}$, $\overline{WR}$, $\overline{MSx}$, $\overline{SW}$, $\overline{HBG}$, PAGE, $\overline{DMAGx}$, $\overline{BMS}$ (in EPROM boot mode).
- 39/ $t_{SDATDGL}$ is the setup requirement if $\overline{DMARx}$ is not being used to hold off completion of a write. Otherwise, if $\overline{DMARx}$ low holds off completion of the write, the data can be driven t_{DATDRH} after $\overline{DMARx}$ is brought high.
- 40/ $t_{VDATDGH}$ is valid if $\overline{DMARx}$ is not being used to hold off completion of a read. If $\overline{DMARx}$ is used to prolong the read, then $t_{VDATDGH} = 8+9DT/16+(n \times t_{CK})$ when n equals the number of extra cycles that the access is prolonged.
- 41/ LACK will go low with t_{DLALC} relative to rising edge of LCLK after first nibble is received. LACK will not go low if the receiver's link buffer is not about to fill.
- 42/ Only required for interrupt recognition in the current cycle.
- 43/ t_{SLSK} is the maximum delay that can be introduced in the transmission path of LDATA relative to LCLK:
 $t_{SLSK} = (t_{LCLKTWH} - t_{LDLCH})_{min} - t_{SLDCLmax}$.
- 44/ If adequate setup time cannot be assured, link port operation should be limited to 1X, or system CLKIN frequency should be reduced to increase the setup margin at 2X.
- 45/ t_{HLSK} is the maximum delay that can be introduced in the transmission path of LCLK relative to LDATA:
 $t_{HLSK} = (t_{LCLKTWL} - t_{HLDCH})_{min} - t_{HLDCLmax}$.
- 46/ Referenced to sample edge.
- 47/ RFS hold after RCK when MCE = 1, MFD = 0 is 0 ns minimum from drive edge. TFS hold after TCK for late external TFS is 0 ns minimum from drive edge.
- 48/ Referenced to drive edge.
- 49/ Applied only to gated serial clock mode used for serial port system I/O in mesh multiprocessing systems. See user's manual.
- 50/ MCE = 1, TFS enable and TFS valid follow $t_{DDTLFSE}$ and $t_{DDTENFS}$.
- 51/ System inputs = $DATA_{47-0}$, $ADDR_{31-0}$, $\overline{RD}$, $\overline{WR}$, ACK, SBTS, $\overline{SW}$, $\overline{HBR}$, $\overline{HBG}$, $\overline{CS}$, $\overline{DMAR1}$, $\overline{DMAR2}$, $\overline{BR6-1}$, ID_{2-0} , RPBA, $\overline{IRQ2-0}$, $\overline{FLAG3-0}$, DR0, DR1, TCLK0, TCLK1, RCLK0, RCLK1, TFS0, TFS1, RFS0, RFS1, $LxDAT_{3-0}$, $LxCLK$, $LxACK$, EBOOT, LBOOT, CLKIN, RESET.
- 52/ System outputs = $DATA_{47-0}$, $ADDR_{31-0}$, $\overline{MS3-0}$, $\overline{RD}$, $\overline{WR}$, ACK, PAGE, ADRCLK, $\overline{SW}$, $\overline{HBG}$, REDY, $\overline{DMAG1}$, $\overline{DMAG2}$, $\overline{BR6-1}$, CPA, $\overline{FLAG3-0}$, TIMEXP, DT0, DT1, TCLK0, TCLK1, RCLK0, RCLK1, TFS0, TFS1, RFS0, RFS1, $LxDAT_{3-0}$, $LxCLK$, $LxACK$, $\overline{BMS}$.

4.2.2 Additional criteria for device classes Q and V.

- a. The burn-in test duration, test condition and test temperature, or approved alternatives shall be as specified in the device manufacturer's QM plan in accordance with MIL-PRF-38535. The burn-in test circuit shall be maintained under document revision level control of the device manufacturer's Technology Review Board (TRB) in accordance with MIL-PRF-38535 and shall be made available to the acquiring or preparing activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in test method 1015 of MIL-STD-883.
- b. Interim and final electrical test parameters shall be as specified in table II herein.
- c. Additional screening for device class V beyond the requirements of device class Q shall be as specified in MIL-PRF-38535, appendix B.

4.3 Qualification inspection for device classes Q and V. Qualification inspection for device classes Q and V shall be in accordance with MIL-PRF-38535. Inspections to be performed shall be those specified in MIL-PRF-38535 and herein for groups A, B, C, D, and E inspections (see 4.4.1 through 4.4.4).

4.4 Conformance inspection. Technology conformance inspection for classes Q and V shall be in accordance with MIL-PRF-38535 including groups A, B, C, D, and E inspections and as specified herein except where option 2 of MIL-PRF-38535 permits alternate in-line control testing. Quality conformance inspection for device class M shall be in accordance with MIL-PRF-38535, appendix A and as specified herein. Inspections to be performed for device class M shall be those specified in method 5005 of MIL-STD-883 and herein for groups A, B, C, D, and E inspections (see 4.4.1 through 4.4.4).

4.4.1 Group A inspection.

- a. Tests shall be as specified in table II herein.
- b. For device class M, subgroups 7 and 8 tests shall be sufficient to verify the functionality of the device. For device classes Q and V, subgroups 7 and 8 shall include verifying the functionality of the device; these tests shall have been fault graded in accordance with MIL-STD-883, test method 5012 (see 1.5 herein).
- c. Subgroup 4 (C_{IN} measurement) shall be measured only for the initial test and after process or design changes which may affect input capacitance. A minimum sample of 5 devices with zero failures shall be required.

4.4.2 Group C inspection. The group C inspection end-point electrical parameters shall be as specified in table II herein.

4.4.2.1 Additional criteria for device class M. Steady-state life test conditions, method 1005 of MIL-STD-883:

- a. Test condition A, B, C, or D. The test circuit shall be maintained by the manufacturer under document revision level control and shall be made available to the preparing or acquiring activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in test method 1005 of MIL-STD-883.
- b. $T_A = +125^{\circ}\text{C}$, minimum.
- c. Test duration: 1,000 hours, except as permitted by method 1005 of MIL-STD-883.

4.4.2.2 Additional criteria for device classes Q and V. The steady-state life test duration, test condition and test temperature, or approved alternatives shall be as specified in the device manufacturer's QM plan in accordance with MIL-PRF-38535. The test circuit shall be maintained under document revision level control by the device manufacturer's TRB in accordance with MIL-PRF-38535 and shall be made available to the acquiring or preparing activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in test method 1005 of MIL-STD-883.

4.4.3 Group D inspection. The group D inspection end-point electrical parameters shall be as specified in table II herein.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-96744
		REVISION LEVEL	SHEET 49

TABLE II. Electrical test requirements.

Test requirements	Subgroups (in accordance with MIL-STD-883, method 5005, table I)	Subgroups (in accordance with MIL-PRF-38535, table III)	
	Device class M	Device class Q	Device class V
Interim electrical parameters (see 4.2)	---	---	1, 7, 9
Final electrical parameters (see 4.2)	1, 2, 3, 7, 8, 9, 10, 11 <u>1/</u>	1, 2, 3, 7, 8, 9, 10, 11 <u>1/</u>	1, 2, 3, 7, 8, 9, 10, 11 <u>2/</u>
Group A test requirements (see 4.4)	1, 2, 3, 4, 7, 8, 9, 10, 11	1, 2, 3, 4, 7, 8, 9, 10, 11	1, 2, 3, 4, 7, 8, 9, 10, 11
Group C end-point electrical parameters (see 4.4)	2, 8A, 10	2, 8A, 10	2, 8A, 10
Group D end-point electrical parameters (see 4.4)	1, 7, 9	1, 7, 9	1, 7, 9
Group E end-point electrical parameters (see 4.4)	1, 7, 9	1, 7, 9	1, 7, 9

1/ PDA applies to subgroup 1.

2/ PDA applies to subgroups 1 and 7.

4.4.4 Group E inspection. Group E inspection is required only for parts intended to be marked as radiation hardness assured (see 3.5 herein).

- a. End-point electrical parameters shall be as specified in table II herein.
- b. For device classes Q and V, the devices or test vehicle shall be subjected to radiation hardness assured tests as specified in MIL-PRF-38535 for the RHA level being tested. For device class M, the devices shall be subjected to radiation hardness assured tests as specified in MIL-PRF-38535, appendix A for the RHA level being tested. All device classes must meet the postirradiation end-point electrical parameter limits as defined in table I at $T_A = +25^{\circ}\text{C} \pm 5^{\circ}\text{C}$, after exposure, to the subgroups specified in table II herein.
- c. When specified in the purchase order or contract, a copy of the RHA delta limits shall be supplied.

5. PACKAGING

5.1 Packaging requirements. The requirements for packaging shall be in accordance with MIL-PRF-38535 for device classes Q and V or MIL-PRF-38535, appendix A for device class M.

6. NOTES

6.1 Intended use. Microcircuits conforming to this drawing are intended for use for Government microcircuit applications (original equipment), design applications, and logistics purposes.

6.1.1 Replaceability. Microcircuits covered by this drawing will replace the same generic device covered by a contractor-prepared specification or drawing.

6.1.2 Substitutability. Device class Q devices will replace device class M devices.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-96744
		REVISION LEVEL	SHEET 50

6.2 Configuration control of SMD's. All proposed changes to existing SMD's will be coordinated with the users of record for the individual documents. This coordination will be accomplished in accordance with MIL-STD-973 using DD Form 1692, Engineering Change Proposal.

6.3 Record of users. Military and industrial users should inform Defense Supply Center Columbus when a system application requires configuration control and which SMD's are applicable to that system. DSCC will maintain a record of users and this list will be used for coordination and distribution of changes to the drawings. Users of drawings covering microelectronic devices (FSC 5962) should contact DSCC-VA, telephone (614) 692-0525.

6.4 Comments. Comments on this drawing should be directed to DSCC-VA, Columbus, Ohio 43216-5000, or telephone (614) 692-0674.

6.5 Abbreviations, symbols, and definitions. The abbreviations, symbols, and definitions used herein are defined in MIL-PRF-38535, MIL-HDBK-1331, and as follows:

<u>Pin symbol</u>	<u>Type</u> 1/	<u>Description</u>
ADDR ₃₁₋₀	I/O/T	External bus address. The processor outputs addresses for external memory and peripherals on these pins. In a multiprocessor system the bus master outputs addresses for read/writes of the internal memory or IOP registers of other processors. The processor inputs addresses when a host processor or multiprocessing bus master is reading or writing its internal memory or IOP registers.
DATA ₄₇₋₀	I/O/T	External bus data. The processor inputs and outputs data and instructions on these pins. 32-bit single-precision floating-point data and 32-bit fixed-point data is transferred over bits 47-16 of the bus. 40-bit extended-precision floating-point data is transferred over bits 47-8 of the bus. 16-bit short word data is transferred over bits 31-16 of the bus. In PROM boot mode, 8-bit data is transferred over bits 23-16. Pull-up resistors on unused DATA pins are not necessary.
$\overline{\text{MS3-0}}$	O/T	Memory select line. These lines are asserted (low) as chip selects for the corresponding banks of external memory. Memory bank size must be defined in the processor system control register (SYSCON). The $\overline{\text{MS3-0}}$ lines are decoded memory address lines that change at the same time as the other address lines. When no external memory access is occurring the $\overline{\text{MS3-0}}$ lines are inactive; they are active, however, when a conditional memory access instruction is executed, whether or not the condition is true. $\overline{\text{MS0}}$ can be used with the PAGE signal to implement a bank of DRAM memory (Bank 0). In a multiprocessing system the $\overline{\text{MS3-0}}$ lines are output by the bus master.
$\overline{\text{RD}}$	I/O/T	Memory read strobe. This pin is asserted (low) when the processor reads from external memory devices or from the internal memory of other processors. External devices (including other processors) must assert $\overline{\text{RD}}$ to read from the processor internal memory. In a multiprocessing system $\overline{\text{RD}}$ is output by the bus master and is input by all other processors.
$\overline{\text{WR}}$	I/O/T	Memory write strobe. The pin is asserted (low) when the processor writes to external memory devices or to the internal memory of other processors. External devices must assert $\overline{\text{WR}}$ to write to the processor's internal memory. In a multiprocessing system $\overline{\text{WR}}$ is output by the bus master and is input by all other processors.

See footnote 1/ on sheet 55.

STANDARD MICROCIRCUIT DRAWING DEFENSE SUPPLY CENTER COLUMBUS COLUMBUS, OHIO 43216-5000	SIZE A		5962-96744
		REVISION LEVEL	SHEET 51

<u>Pin symbol</u>	<u>Type</u> <u>1/</u>	<u>Description</u> - Continued.
PAGE	O/T	DRAM page boundary. The processor asserts this pin to signal that an external DRAM page boundary has been crossed. DRAM page size must be defined in the processor's memory control register (WAIT). DRAM can only be implemented in external memory bank 0; the PAGE signal can only be activated for bank 0 accesses. In a multiprocessing system PAGE is output by the bus master.
ADRCLK	O/T	Clock output reference. In a multiprocessing system ADRCLK is output by the bus master.
$\overline{SW}$	I/O/T	Synchronous write select. This signal is used to interface the device to synchronous memory devices (including other processors). The processor asserts $\overline{SW}$ (low) to provide an early indication of an impending write cycle, which can be aborted if $\overline{WR}$ is not later asserted (e.g., in a conditional write instruction). In a multiprocessing system, $\overline{SW}$ is output by the bus master and is input by all other processors to determine if the multiprocessor memory access is a read or write. $\overline{SW}$ is asserted at the same time as the address output. A host processor using synchronous writes must assert this pin when writing to the processor(s).
ACK	I/O/S	Memory acknowledge. External devices can deassert ACK (low) to add wait states to an external memory access. ACK is used by I/O devices, memory controllers, or other peripherals to hold off completion of an external memory access. The processor deasserts ACK as an output to add wait states to a synchronous access of its internal memory. In a multiprocessing system, a slave processor deasserts the bus master's ACK input to add wait state(s) to an access of its internal memory. The bus master has a keeper latch on its ACK pin that maintains the input at the level it was last driven to.
$\overline{SBTS}$	I/S	Suspend bus three-state. External devices can assert $\overline{SBTS}$ (low) to place the external bus address, data, selects, and strobes in a high-impedance state for the following cycle. If the processor attempts to access external memory while $\overline{SBTS}$ is asserted, the processor will halt and the memory access will not be completed until $\overline{SBTS}$ is deasserted. $\overline{SBTS}$ should only be used to recover from host processor/processor dead lock, or used with a DRAM controller.
$\overline{IRQ2-0}$	I/A	Interrupt request lines. May be either edge-triggered or level-sensitive.
FLAG ₃₋₀	I/O/A	Flag pins. Each is configured via control bits as either an input or output. As an input, it can be tested as a condition. As an output, it can be used to signal external peripherals.
TIMEXP	O	Timer expired. Asserted for four cycles when the timer is enabled and TCOUNT decrements to zero.
$\overline{HBR}$	I/A	Host bus request. Must be asserted by a host processor to request control of the processor's external bus. When $\overline{HBR}$ is asserted in a multiprocessing system, the processor that is bus master will relinquish the bus and assert $\overline{HBG}$. To relinquish the bus, the processor places the address, data, select, and strobe lines in a high-impedance state. $\overline{HBR}$ has priority over all processor bus requests (BR6-1) in a multiprocessing system.

See footnote 1/ on sheet 55.

COLUMBUS, OHIO 43216-5000

SIZE
A

5962-96744

REVISION LEVEL

SHEET
52

<u>Pin symbol</u>	<u>Type</u> <u>1/</u>	<u>Description</u> - Continued.
$\overline{\text{HBG}}$	I/O	Host bus grant. Acknowledges an $\overline{\text{HBR}}$ bus request, indicating that the host processor may take control of the external bus. $\overline{\text{HBG}}$ is asserted (held low) by the processor until $\overline{\text{HBR}}$ is released. In a multiprocessing system, $\overline{\text{HBG}}$ is output by the processor bus master and is monitored by all others.
$\overline{\text{CS}}$	I/A	Chip select. Asserted by host processor to select the processor.
REDY (o/d)	O	Host bus acknowledge. The processor deasserts REDY (low) to add wait states to an asynchronous access of its internal memory or IOP registers by a host. Open drain output (o/d) by default; can be programmed in ADREDY bit of SYSCON register to be active drive (a/d). REDY will only be output if the $\overline{\text{CS}}$ and $\overline{\text{HBR}}$ inputs are asserted.
$\overline{\text{DMAR1}}$	I/A	DMA request 1 (DMA channel 7).
$\overline{\text{DMAR2}}$	I/A	DMA request 2 (DMA channel 8).
$\overline{\text{DMAG1}}$	O/T	DMA grant 1 (DMA channel 7).
$\overline{\text{DMAG2}}$	O/T	DMA grant 2 (DMA channel 8).
$\overline{\text{BR6}} - 1$	I/O/S	Multiprocessing bus requests. Used by multiprocessing processors to arbitrate for bus mastership. A processor only drives its own $\overline{\text{BRx}}$ line (corresponding to the value of its ID ₂₋₀ inputs) and monitors all others. In a multiprocessor system with less than six processors, the unused $\overline{\text{BRx}}$ pins should be pulled high; the processor's own $\overline{\text{BRx}}$ line must not be pulled high or low because it is an output.
ID ₂₋₀	I	Multiprocessing ID. Determines which multiprocessing bus request ($\overline{\text{BR1}} - \overline{\text{BR6}}$) is used by processor. ID = 001 corresponds to $\overline{\text{BR1}}$, ID = 010 corresponds to $\overline{\text{BR2}}$, etc. ID = 000 in single-processor systems. These lines are a system configuration selection which should be hardwired or only changed at reset.
RPBA	I/S	Rotating priority bus arbitration select. When RPBA is high, rotating priority for multiprocessor bus arbitration is selected. When RPBA is low, fixed priority is selected. This signal is a system configuration selection which must be set to the same value on every processor. If the value of RPBA is changed during system operation, it must be changed in the same CLKIN cycle on every processor.
$\overline{\text{CPA}}$ (o/d)	I/O	Core priority access. Asserting its $\overline{\text{CPA}}$ pin allows the core processor of a processor bus slave to interrupt background DMA transfers and gain access to the external bus. $\overline{\text{CPA}}$ is an open drain output that is connected to all processors in the system. The $\overline{\text{CPA}}$ pin has an internal 5 k Ω pullup resistor. If core access priority is not required in a system, the $\overline{\text{CPA}}$ pin should be left unconnected.
DTx	O	Data transmit (serial ports 0,1). Each DT pin has a 50 k Ω internal pullup resistor.
DRx	I	Data receive (serial ports 0,1). Each DR pin has a 50 k Ω internal pullup resistor.

See footnote 1/ on sheet 55.

LxCLK	I/O	Link port clock (link ports 0-5). Each LxCLK pin has a 50 kΩ internal pulldown resistor which is enabled or disabled by the LPDRD bit of the LCOM register.																												
LxACK	I/O	Link port acknowledge (link ports 0-5). Each LxACK pin has a 50 kΩ internal pulldown resistor which is enabled or disabled by the LPDRD bit of the LCOM register.																												
EBOOT	I	EPROM boot select. When EBOOT is high, the processor is configured for booting from an 8-bit EPROM. When EBOOT is low, LBOOT and $\overline{\text{BMS}}$ inputs determine booting mode. See table below. This signal is a system configuration selection which should be hardwired.																												
LBOOT	I	Link boot. When LBOOT is high, the processor is configured for link port booting. When LBOOT is low, the processor is set up for host processor booting or no booting. See table below. This signal is a system configuration selection which should be hardwired.																												
$\overline{\text{BMS}}$	I/O/T*	Boot memory select. Output: Used as chip select for boot EPROM devices (when EBOOT = 1, LBOOT = 0). In a multiprocessor system, $\overline{\text{BMS}}$ is output by the bus master. Input: When low, indicates that no booting will occur and that processor will begin executing instructions from external memory. See table below. This input is a system configuration selection which should be hardwired.																												
<table><tr><th><u>EBOOT</u></th><th><u>LBOOT</u></th><th><u>BMS</u></th><th><u>Booting mode</u></th></tr><tr><td>1</td><td>0</td><td>output</td><td>EPROM (connect $\overline{\text{BMS}}$ to EPROM chip select)</td></tr><tr><td>0</td><td>0</td><td>1 (input)</td><td>Host processor</td></tr><tr><td>0</td><td>1</td><td>1 (input)</td><td>Link port</td></tr><tr><td>0</td><td>0</td><td>0 (input)</td><td>No booting. 0	0	0 (input)	No booting. Processor executes from external memory.																											
0	1	0 (input)	Reserved																											
1	1	x (input)	Reserved																											
* Three-statable only in EPROM boot mode (when $\overline{\text{BMS}}$ is an output).																														
CLKIN	I	Clock in. External clock input to the processor. The instruction cycle rate is equal to CLKIN. CLKIN may not be halted, changed, or operated below the specified frequency.																												
$\overline{\text{RESET}}$	I/A	Processor reset. Resets the processor to a known state and begins execution at the program memory location specified by the hardware reset vector address. This input must be asserted (low) at power-up.																												

See footnote 1/ on sheet 55.

<u>Pin symbol</u>	<u>Type</u> 1/	<u>Description</u> - Continued.
TCK	I	Test clock (JTAG). Provides an asynchronous clock for JTAG boundary scan.
TMS	I/S	Test mode select (JTAG). Used to control the test state machine. TMS has a 20 kΩ internal pullup resistor.
TDI	I/S	Test data input (JTAG). Provides serial data for the boundary scan logic. TDI has a 20 kΩ internal pullup resistor.
TDO	O	Test data output (JTAG). Serial scan output of the boundary scan path.
$\overline{\text{TRST}}$	I/A	Test reset (JTAG). Resets the test state machine. $\overline{\text{TRST}}$ must be asserted (pulsed low) after power-up or held low for proper operation of the processor. $\overline{\text{TRST}}$ has a 20 kΩ internal pullup resistor.
$\overline{\text{EMU}}$ (o/d)	O	Emulation status. Must be connected to the processor EZ-ICE target board connector only.
ICSA	O	Reserved, leave unconnected.
VDD	P	Power supply, nominally +3.3 V dc (30 pins).
GND	G	Power supply return (30 pins).
NC	---	Do not connect. Reserved pins which must be left open and unconnected.

6.6 Sources of supply.

6.6.1 Sources of supply for device classes Q and V. Sources of supply for device classes Q and V are listed in QML-38535. The vendors listed in QML-38535 have submitted a certificate of compliance (see 3.6 herein) to DSCC-VA and have agreed to this drawing.

6.6.2 Approved sources of supply for device class M. Approved sources of supply for class M are listed in MIL-HDBK-103. The vendors listed in MIL-HDBK-103 have agreed to this drawing and a certificate of compliance (see 3.6 herein) has been submitted to and accepted by DSCC-VA.

1/ A = Asynchronous
G = Ground
I = Input
O = Output
P = Power Supply
S = Synchronous
A/D = Active Drain
O/D = Open Drain
T = Three-state (when $\overline{\text{SBTS}}$ is asserted or when the processor is a bus slave.)

STANDARD MICROCIRCUIT DRAWING BULLETIN

DATE: 99-11-24

Approved sources of supply for SMD 5962-96744 are listed below for immediate acquisition information only and shall be added to MIL-HDBK-103 and/or QML-38535 during the next revision. MIL-HDBK-103 and/or QML-38535 will be revised to include the addition or deletion of sources. The vendors listed below have agreed to this drawing and a certificate of compliance has been submitted to and accepted by DSCC-VA. This bulletin is superseded by the next dated revision of MIL-HDBK-103 and/or QML-38535.

- 1/ The lead finish shown for each PIN representing a hermetic package is the most readily available from the manufacturer listed for that part. If the desired lead finish is not listed, contact the vendor to determine its availability.
- 2/ Caution. Do not use this number for item acquisition. Items acquired to this number may not satisfy the performance requirements of this drawing.
- 3/ Not available from an approved source of supply.
