

256 K $\times$ 1 Very Low Power CMOS SRAM

Introduction

The M65697 is a very low power CMOS static RAM organized as 262144×1 bit. It is manufactured using the TEMIC high performance CMOS technology named SCMOS.

With this process, TEMIC is the first to bring the solution for applications where fast computing is as mandatory as low consumption, such as aerospace electronics, portable instruments or embarked systems.

Utilizing an array of six transistors (6T) memory cells, the M65697 combines an extremely low standby

supply current (Typical value = 0.1 μA) with a fast access time at 40 ns. The high stability of the 6T cell provides excellent protection against soft errors due to noise.

Extra protection against heavy ions is given by the use of an epitaxial layer of a P substrate.

The M67697 is 100 % processed following the test methods of MIL STD 883 and/or ESA/SCC 9000, making it ideally suitable for military/space applications that demand superior levels of performance and reliability.

Features

- Access time
commercial : 35(*), 40, 45, 55 ns
industrial and military : 40(*), 45, 55 ns
- Very low power consumption
active : 50 mW (typ)
standby : 0.5 μ W (typ)
data retention : 0.4 μ W (typ)
- Wide temperature range : -55 to + 125 °C
- 300 mils width package
- TTL compatible inputs and outputs
- Asynchronous
- Single 5 volt supply
- Equal cycle and access time
- Gated inputs : no pull-up/down
resistors are required

Data Retention Mode

MHS CMOS RAM's are designed with battery backup in mind. Data retention voltage and supply current are guaranteed over temperature. The following rules insure data retention :

1. Chip select ($\overline{CS}$) must be held high during data retention ; within V_{CC} to $V_{CC} - 0.2$ V.
2. $\overline{CS}$ must be kept between $V_{CC} - 0.3$ V and 70 % of V_{CC} during the power up and power down transitions.
4. The RAM can begin operation > 45 ns after V_{CC} reaches the minimum operating voltage (4.5 V).

Write Cycle 1 : $\overline{W}$ Controlled (note 12)

Write Cycle 2 : $\overline{CS}$ Controlled (note 12)

Note : 12. The internal write time of the memory is defined by the overlap of $\overline{CS}$ LOW and $\overline{W}$ LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.
