DESCRIPTION

The L9307/9 is a monolithic integrated circuit with differential input comparator and open collector output able to sink high current specially to drive relays, lamps, d.c. motors.

Particular care has been taken to protect the device against destructive failures, i.e. short circuit of outputs to V_s , SOA protection, supply overvoltage.

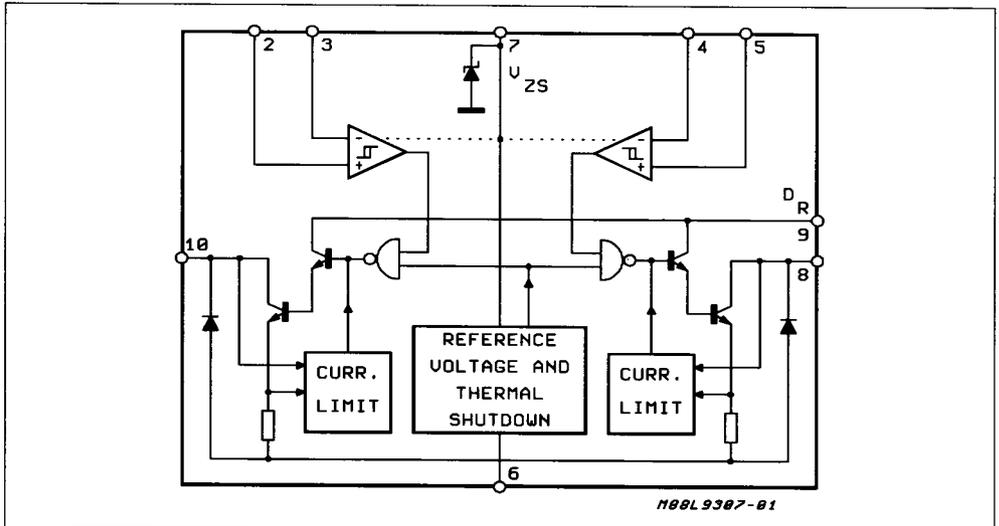

A built in thermal shut-down switches off the device when the IC's internal dissipation becomes

too high and the chip temperature exceeds security threshold.

The input comparator hysteresis increases the interface's noise immunity allowing the correct use in critical environments as automotive applications.

(**) The maximum allowed supply voltage without limiting resistor is limited by the built-in protection zener diode; see V_{ZS} spec. values if V_S higher than V_{ZS} a resistor R_S is necessary to limit the zener current I_{ZS} .
