ST7MDT1-DVP

DEVELOPMENT KIT FOR ST72251G1/G2, ST72101G1/G2, ST72212G2 AND ST72213G1 MCUs

PREFACE

Purpose of the Manual

This manual describes how to start and use the ST7MDT1-DVP Development Kit for the ST72251G2 series MCUs, allowing you to get acquainted with the ST7 microcontroller world and become familiar with the methods for developing and debugging ST7-driven applications.

The ST72251G2 covers the ST72101G1/G2, ST72212G2, ST72213G1 and ST72251G1/G2 MCUs

The manual also provides a guidance for programming a selection of ST7 microcontrollers, in EPROM or One Time Programmable (OTP) mode.

Audience

This book is intended for persons:

• who wish to evaluate how to design and test applications using ST7 microcontrollers,

• who want to use the ST7MDT1-DVP Development Kit to meet their actual application development needs.

No preliminary knowledge in the field of microcontrollers is required.

Related Publications

The following publications contain useful complementary information:

• *ST7-Family, Data Sheets*,

• *ST7-Family, 8-bit MCUs, Product Overview*, Ref. BKST7/2

• *Software Tools for the ST7 Family*, Ref. Doc-ST7ASMLK-SW

• *ST7-Family, Programming Manual*,

• *Windows Debugger for the ST7 Family*, Doc-ST7-WGDB7. This manual will help you debug and finalize your programs.

Rev. 1.01

Table of Contents

Table of Contents

Standard Compliance

This product is conform to the 89/336/EEC Directive. It complies with the EN55022 emissions standard for ITE and generic 50082-1 immunity standards.

Organization of the Manual

This manual comprises five chapters and an index:

Chapter 1, WHAT THE DEVELOP-MENT KIT AF-FORDS YOU, provides a general description of the components of the Development Kit.

Chapter 2, WHAT YOU CAN DO WITH THE DEVELOP-MENT KIT, is a quick introduction to the Develop-ment Kit.

Chapter 3, **GETTING START-ED**, explains how to in-stall and use the components of the Development Kit.

Chapter 4, HARD-WARE FEA-TURES, introduc-es you to the Emu-lator and the De-vice programmer.

Chapter 5, **SOFTWARE FEA-TURES**, discusses the soft-ware tools that are included in the De-velopment Kit.

INDEX

1 WHAT THE DEVELOPMENT KIT AFFORDS YOU

1.1 A Wide Range of Functions

The ST7MDT1-DVP Development Kit for the ST72251G2 series MCUs contains all the necessary resources that will help you:

- design,

- develop,

- debug ST7 application software running in a real environment,

- and program ST72101G1/G2, ST72212G2, ST72213G1 and ST72251G1/G2 devices in both EPROM and OTP modes.

NOTE: These functions are currently available for devices with SDIP32 packages. You may however use devices with SO28 packages by adding the appropriate ZIF socket on the board (See "Development Board Layout" on page 9).

Table 1. ST72251G2 Series Summary

Device	ROM	RAM	A/D	Timer	SPI	I2C
ST72101G1	4K	256	No	1x16 bits	Yes	No
ST72101G2	8K	256	No	1x16 bits	Yes	No
ST72213G1	4K	256	6x8 bits	1x16 bits	Yes	No
ST72212G2	8K	256	6x8 bits	2x16 bits	Yes	No
ST72251G1	4K	256	6x8 bits	2x16 bits	Yes	Yes
ST72251G2	8K	256	6x8 bits	2x16 bits	Yes	Yes

1.2 Package Description

The ST7MDT1-DVP Development Kit package contains:

Hardware

- One development board with a cable for PC connection (Ref. MB 212/B),

- One SDIP32 passive probe (Ref. DB 320/A) and one 34-pt flat cable for user application connection,

- One 5 V external DC power supply with cable,

- 2 ST72251G2 MCU samples,

- One CD ROM and disks for documentation and software.

The board is connected through a parallel port interface to a PC used to monitor debugging and device programming operations.

Software and Documentation

The CD-ROM and the disks contain:

- The present guide,

- An emulator-aided debugger,

- Software Tools, comprising a source-level debugger operating with the development board or an ST7 simulator, an assembler, a linker, an ST7 eprom programmer, and associated user documentation,

- A basic C-compiler, for demonstration purposes only,

- A device epromer,

- ST7 application notes, with sources.

Figure 1. Software/Hardware Structure of the ST7MDT1-DVP Development Kit

**Figure 2. ST7MDT1-DVP Development Kit General Configuration**

1.3 Board Functional Configurations

The development board of the ST7MDT1-DVP Development Kit can be used as an ST7 MCU Emulator or as an ST7 MCU Programming Board, as shown in the figures next page.

Figure 3. Using the Development Board as an ST7 MCU Emulator
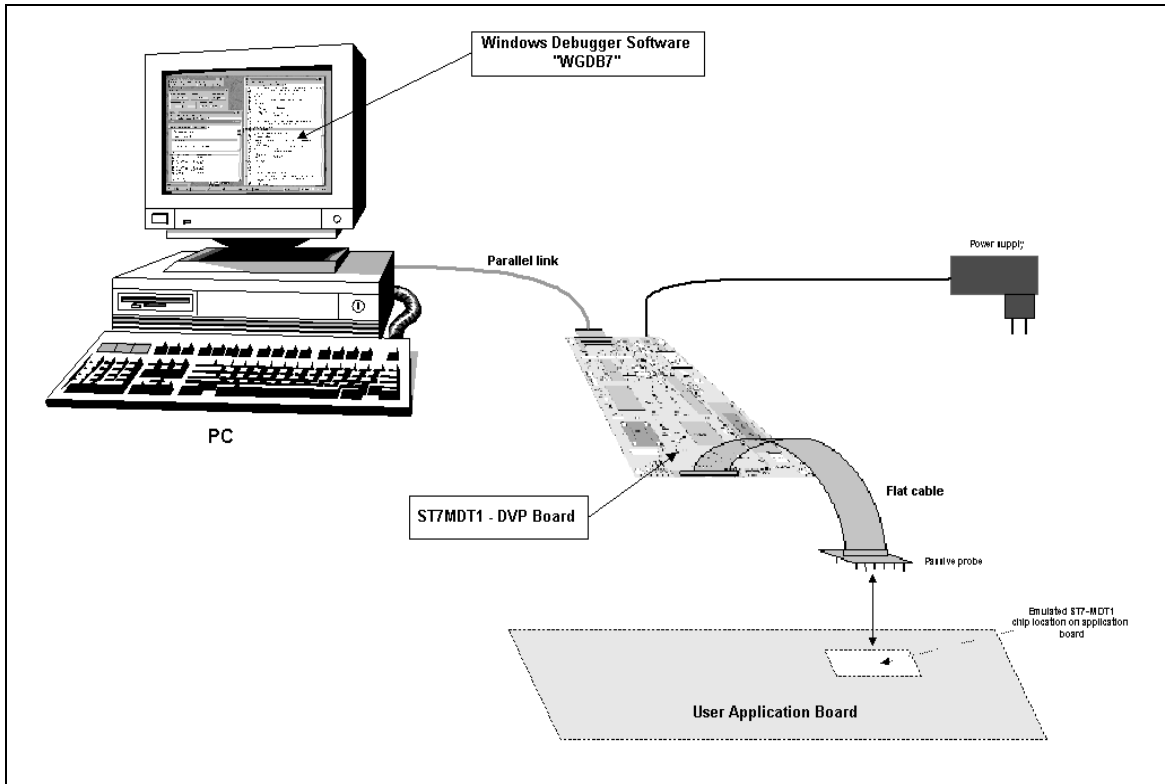

Figure 4. Using the Development Board as an ST7 MCU Programming Board
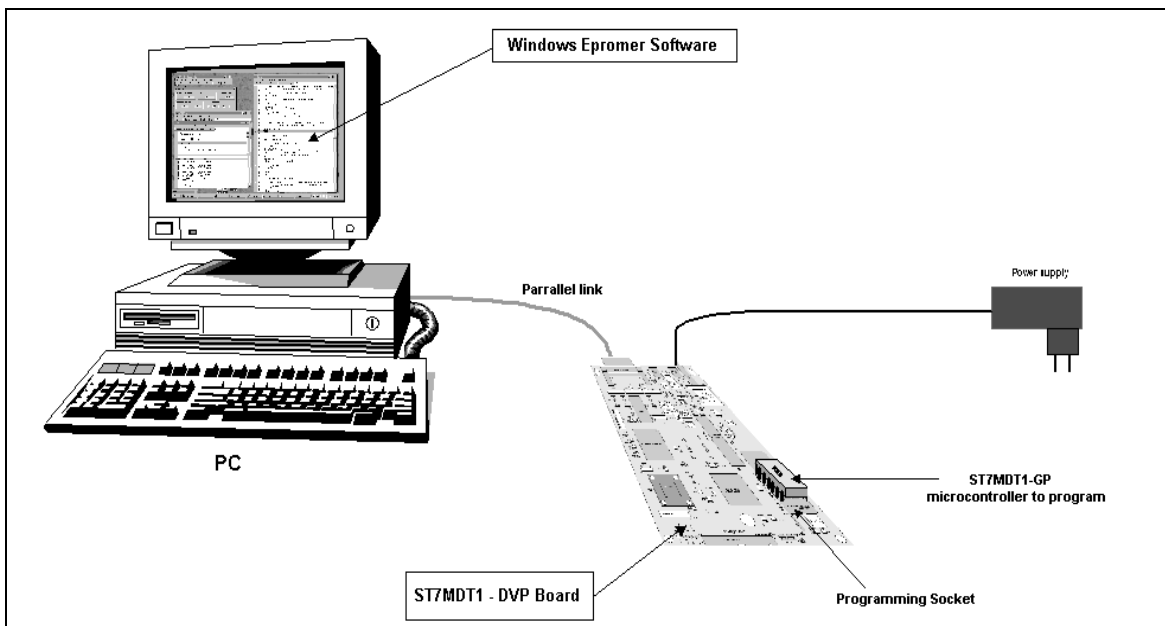

1.4 Development Board Layout
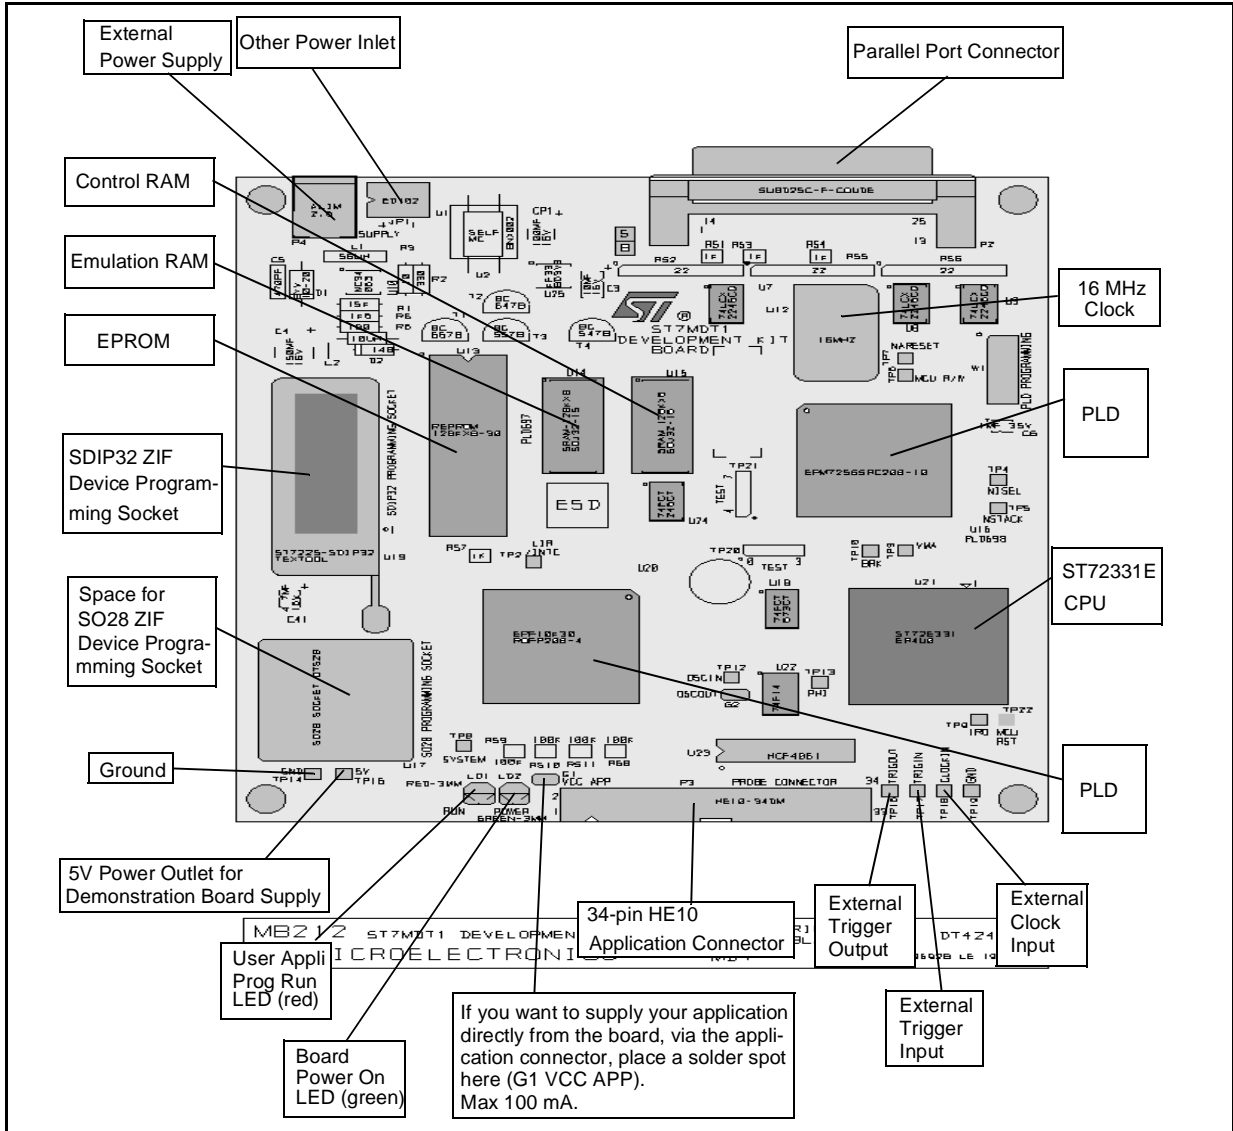

WARNING

The ST7MDT1-DVP Development Kit board is a Class-A apparatus. In a residential environment, it may cause radioelectrical disturbances. Also, the The ST7MDT1-DVP Development Kit board is not contained in an outer casing; consequently, it cannot be immune against electrostatic discharges (ESD). It should therefore be handled only in static safe working areas.

2 WHAT YOU CAN DO WITH THE DEVELOPMENT KIT

2.1 Preliminary Contacts

Let's suppose that you have just unpacked your ST7MDT1-DVP Development Kit.

You're eager to try it.

Try it now!

2.1.1 Connect and Power Up the Development Board

1   **Connect the development board (P2 connector) to the parallel port (LPT1 or LPT2) of your PC via the appropriate cable.**

2   **Connect the probe (P3 connector) using the flat cable that has been supplied in the package.**

3   **Power up the board.**

Watch! the green POWER LED lights up.

2.1.2 Install and Setup the Software

1   **Insert the delivery CD ROM into your CD ROM drive.**

2   **Using Windows Explorer, open the root directory of your CDROM drive**

3   **Double-click WELCOME.PDF.**

Watch! the Welcome Window opens:
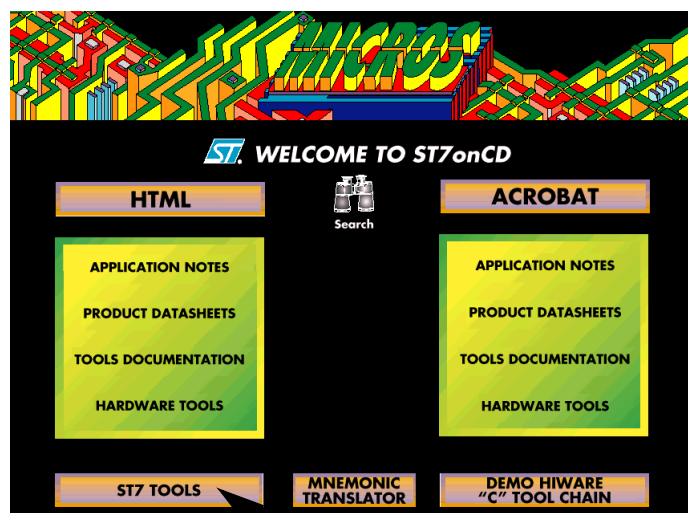

Click here

1   **Click ST7 TOOLS on the Welcome window.**

The ***ST7 Tool Chain Setup*** introductory window appears on your screen.

Click **Next** to continue.

2   **In the next window, *Choose Destination Location*, Click Next to continue (using the default folder (or directory) for the software to be loaded to.**

3   **In the next window, *Select Components*, click the *Wgdb7 Debugger* and *Development Kit*, *ST Assembler Chain* and *Windows Epromer* check boxes. Leave other check boxes empty.**

Click **Next** to continue.

4   **The next window, *Check Setup Information*, displays the settings you have specified:**

Click **Next** to confirm.

5   **The copying process takes place.**

Watch! A progress indicator keeps you informed of the status of the operation. When the copying process terminates, you are directed to the ***Setup Complete*** window.

2.2 Start Working with the Development Kit

From now on, you can do whatever you want in the scope of your development activities.

You can:

• Code your applications using the ***ST Assembly Chain***,

• Debug your applications using the ***WGDB7 Debugger*** with either the ST7 Simulator (no hardware needed), the Emulator, or the Development Board,

• Program any ST72251G2 series device with the application you just developed, using the ***Windows Epromer*** software.

To start any of these tools, just click the corresponding icon (or name in the cascading menus) in the Windows desktop.

––––––––

NOTE: Chapter 3, *Getting Started*, will provide you with more detailed information on how to start a session, and how to activate the tools.

3 GETTING STARTED

3.1 Hardware Installation

3.1.1 Antistatic Requirements

3.1.1.1 Testers and Tools

Any tester, equipment, or tool used at any production step or for any manipulation of semiconductor devices must have its shield connected to GROUND.

3.1.1.2 Antistatic Equipment

An antistatic equipment should comprise:

- A conductive table top, made of steel or clean aluminium or covered by an antistatic surface (superficial resistivity equal to or higher than 0.5 Megohm/cm2), grounded through a ground cable (conductive cable from protected equipment to ground isolated through a 1-Megohm resistor placed in series).

- An antistatic floor covering grounded through a conductive ground cable (with serial resistor between 0.9 and 1.5 Megohm).

3.1.1.3 Manipulation of Finish Goods

Manipulation of finish goods must be made at a grounded worktable.

It is mandatory to wear an antistatic wrist or ankle strap, connected to the antistatic floor covering or to the grounded equipment.

It is mandatory to wear antistatic gloves or finger coats.

Nylon clothing is prohibited during manipulation of parts.

The worktable must be free of any non antistatic plastic objects.

The wearing of the antistatic strap must be controlled every day.

3.1.2 Powering Up the Evaluation Board

Proceed as follows:

1 **Connect the evaluation board (P2 connector) to the parallel port (LPT1 or LPT2) of your PC via the appropriate cable.**

NOTE: The supplied interface cable has been tested in order to operate properly on most PCs. Do not use any other cable, especially if it is longer than the one provided by STMicroelectronics: the board may not operate properly.

The cable should be connected directly to the DB-25 female connector of the PC parallel port. This connector is similar to the one installed on the board. Do not insert any

additional cables or switchboxes between the PC and the board: a malfunctioning of the board may result.

If a dongle is mounted on the PC parallel port, it should not interfere with the programming board. Should you notice a dysfunctioning of the board, remove the dongle and restart the installation procedure.

2 Connect the probe (P3 connector) using the flat cable that has been supplied in the package.

3 Power up the board.

NOTE: The board can also be fed via the JP1 connector by an external stabilized power supply (5V ± 0.25 V, 1 A) not provided with the Kit.

If the board is fed via the JP1 two-point connector make sure that the right feeders lead to the right polarities.

The green POWER LED lights up.

3.2 Software Installation

To install and setup the ST7MDT1-DVP Development Kit software, follow these steps:

1 Insert the delivery CD-ROM into your CD-ROM drive.

2 Using Windows Explorer, open the root directory of your CDROM drive.

Table 2.

| IF	THEN...
Acrobat Reader is already installed on your system.	Double-Click WELCOME.pdf. When the Welcome screen is displayed, click ST7 TOOLS
Acrobat Reader is not yet installed on your system	1. Open the PROGRAM folder/ACROBAT3/ 2. Select and install the appropriate language version of Acrobat (for more details refer to the readme.txt in the CDROM root directory) 3. When Acrobat is installed Double-Click WELCOME.pdf. When the Welcome screen is displayed, click ST7 TOOLS

Click here
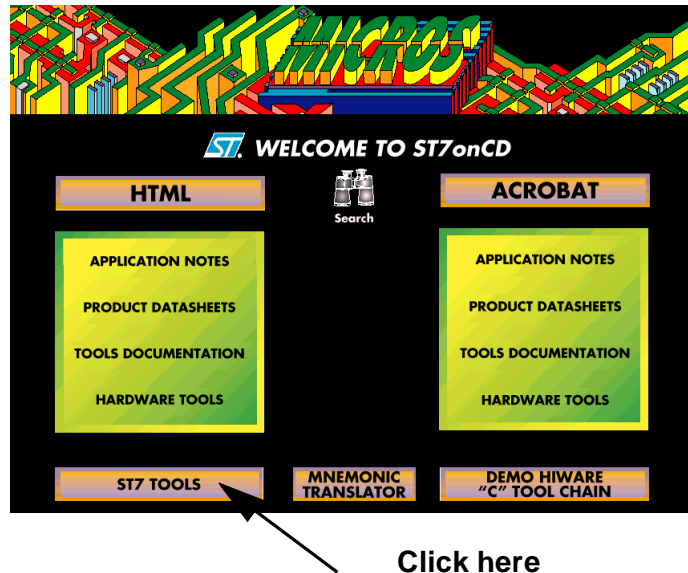

The **ST7 Tool Chain Setup** introductory window appears on your screen, referring to the three software components of the ST7MDT1-DVP Development Kit:

- WGDB7 Debugger

- ST Assembly Chain for the ST7 Family

- ST7 Epromer

Click **Next** to continue.

3   In the next window, *Choose Destination Location*, you will specify the folder (or directory) where to copy the whole ST7MDT1-DVP Development Kit software. Use the default folder (or directory) or choose another folder (or directory):
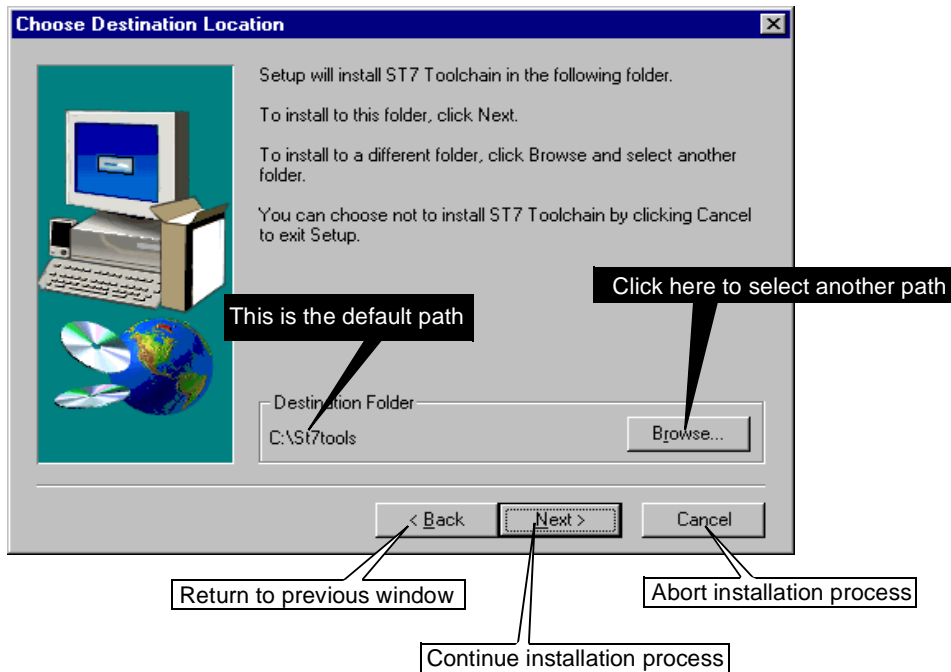

Click **Next** to continue.

4   In the next window, *Select Components*, you will select the software components that are to be copied from the CD-ROM into the folder (directory) you specified before.

NOTE: If you select the Development Kit, it is not necessary to select the HDS Emulator at the same time (don't check the corresponding box).
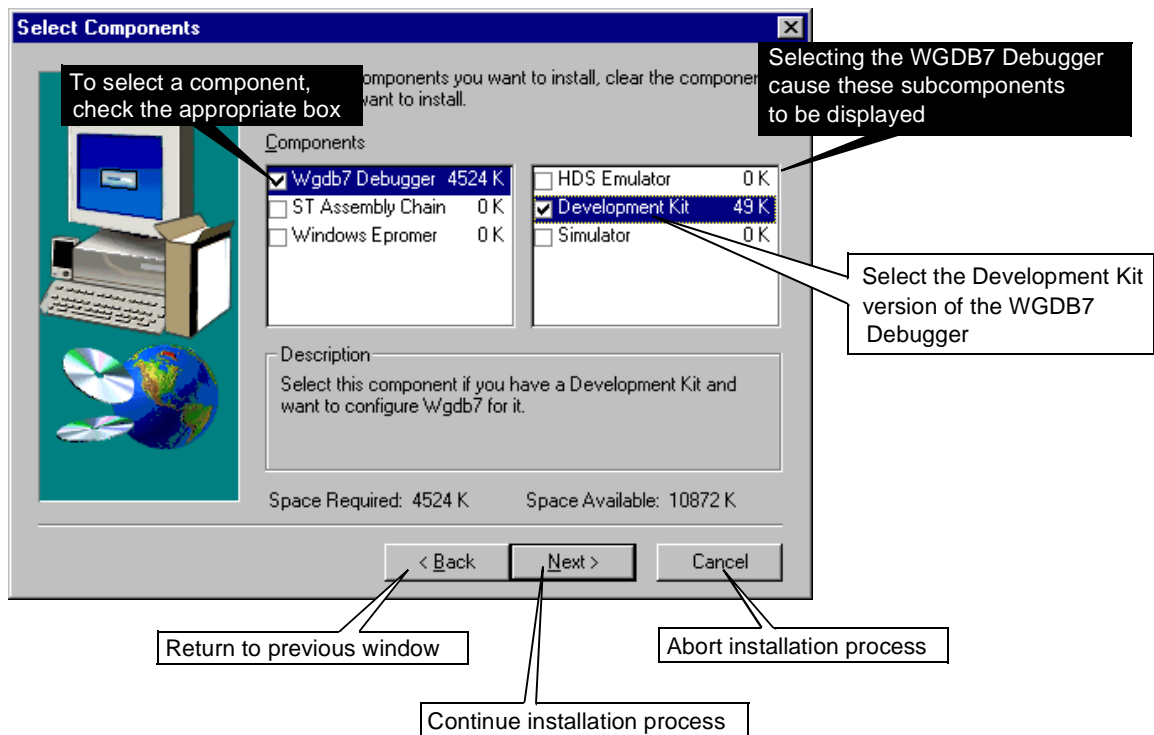

Click **Next** to continue.

5 The next window, *Check Setup Information*, displays the settings you have specified:

- • Destination folder (directory)

- • Components to be installed

Click **Next** to confirm. Click **Back** to change any settings.

6 The copying process takes place. A progress indicator keeps you informed of the status of the operation.

When the copying process terminates, and if you didn't select the **ST Assembly Chain** as a component for the installation, you are directed to the **Setup Complete** window (see further on).

If you selected the **ST Assembly Chain**, you are prompted to modify your AUTOEXEC.BAT file (or your system registry).

These changes affect:

- the **PATH** option, where the path for the components of the Assembly Chain should be added,

- the **METAI** and **DOS4G** environment variables that have to be set to the following val-

ues, respectively:

```
SET METAI=C:\<install folder>\asm
```

where `<install  folder>` is the installation root folder (directory), St7tools by default.

```
SET DOS4G=QUIET
```

You may let the system proceed to the changes or make the changes by yourself. In any case, for the modifications to be effective, you will have to reboot the system. If you make the changes by yourself, the values to be typed can be found in:

```
C:\<install folder>\asm\St7vars.bat
```

where `<install  folder>` is the installation root folder (directory), **St7tools** by default.

For more information, refer to the *ST7 Software Tools for the ST7 Family* User Manual.

You are then directed to the **Setup Complete** window.
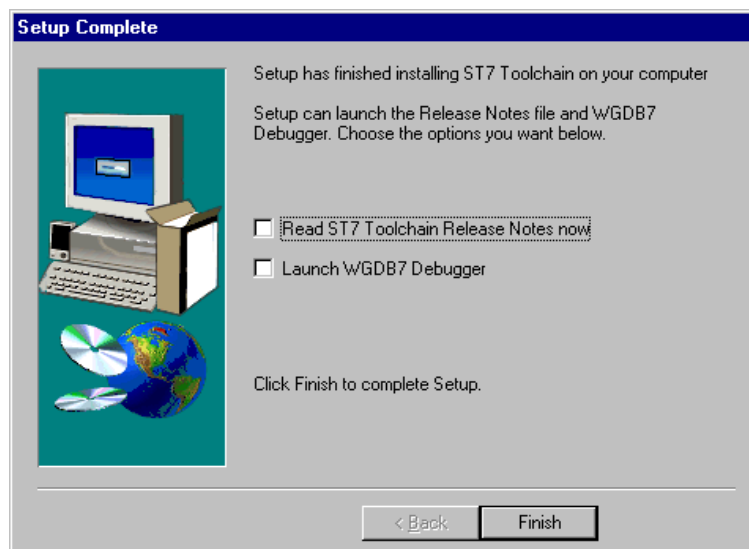

By checking the appropriate box, you may display a Release Note for the WGDB7 Debugger, Version 2.0, and/or start a debugging session, immediately after the installation is completed.

3.3 Using the ST Assembly Chain

The **ST Assembly Chain** components are installed in a subdirectory of the installation root directory, named **asm**.

By default, you will find all the software development tools that constitute the **ST Assembly Chain** in:

```
C:\St7tools\asm
```

For more information on how to develop applications or programs for the ST7 microcontroller, refer to the *Software Tools for the ST7 Family* User Manual included in the CD-ROM.

3.4 Starting the WGDB7 Debugger

The WGDB7 debugger is installed in the installation root directory. By default, you will find it in:

```
C:\St7tools
```

To start WGDB7, just click the WGDB7 Development Kit icon (or name in the cascading menus) in the Windows desktop. The WGDB7 Introductory window appears:
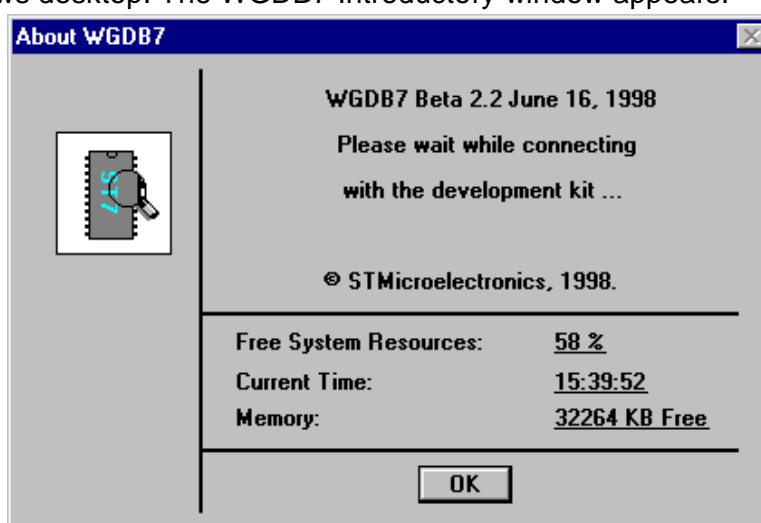

NOTE: To start WGDB7 with the *simulator* you would only click the **WGDB7 Simulator** icon or name in the cascading menus in the Windows desktop. Similarly, to start WGDB7 with the *emulator* you would only click **WGDB7 Emulator** in the Windows desktop.

The debugging session starts a few seconds later.

To get accustomed to the product, you may start one of the sample programs provided with the package, via the **File/Open** debugger menu chain.

The sample programs can be found in:

```
C:\<install folder>\sample
```

where `<install folder>` is the installation root folder (directory), `St7tools` by default.

For more information on how to use the WGDB7 Debugger, refer to the *WGDB7 Windows Debugger for the ST7 Family* User Manual included in the CD-ROM.

3.5 Programming ST7 Devices

3.5.1 Target Devices

Once bug-free and ready for operation, the program you just developed needs to be transferred into an ST7 MCU program space.

With the ST7MDT1-DVP Development Kit, you may program these MCUs (*):

ST72101 G1 or G2

ST72212 G2

ST72213 G1

ST72251 G1 or G2

(*) This list is subject to modifications

We recommend that you practise device programming using one of the sample MCUs provided with the ST7MDT1-DVP Development Kit.

3.6 Device Installation

Place the device into the zero insertion force socket (ZIF) socket mounted on the board (location U19 for SDIP32 devices) with the erasure window on top and pin 1 matching the mark on the board.

NOTE: You may also use SO28 devices by adding the appropriate ZIF socket on the board on the footprint provided at location U17. The reference number of the socket (not supplied with the Kit) is **EMPLAS OTS 28-1.27-04**.

CAUTION

Placing the device into a socket without care may damage the device or the board.

Never insert or remove devices when supplied. Devices are supplied only during read or write operations.
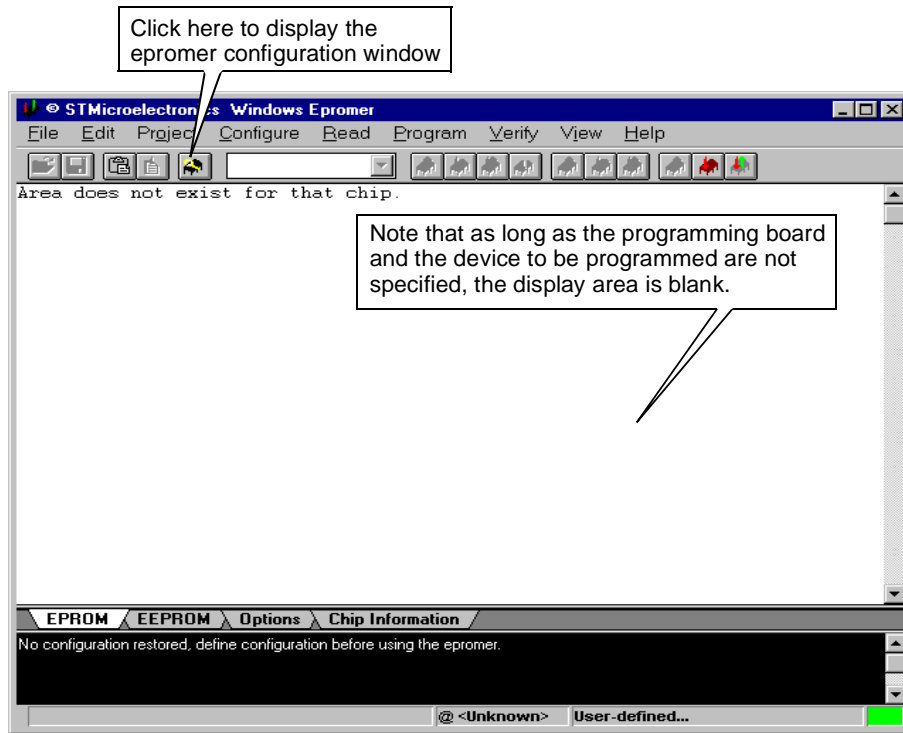

3.6.1 Starting the Windows Epromer

The Windows Epromer (Winee) is installed in the epromer directory. By default, you will find it in:

```
C:\St7tools\epromer
```

To start the Windows Epromer, just click the corresponding icon (or name in the cascading menus) in the Windows desktop.

The Epromer main window appears:
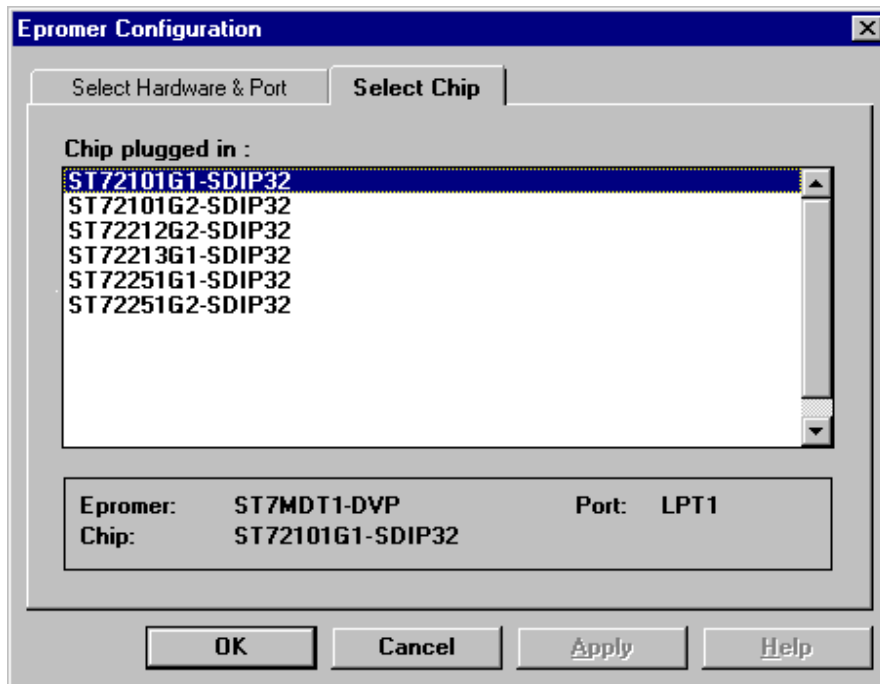

Click here to display the
epromer configuration window

© STMicroelectronics Windows Epromer

File Edit Project Configure Read Program Verify View Help

Area does not exist for that chip.

Note that as long as the programming board
and the device to be programmed are not
specified, the display area is blank.

EPROM / EEPROM \ Options \ Chip Information /

No configuration restored, define configuration before using the epromer.

@ <Unknown>   User-defined...

3.6.2 Configuring the Epromer

Follow these steps:

1 **In the main window tool bar, click the** 📷 **icon to select the epromer configuration window:**
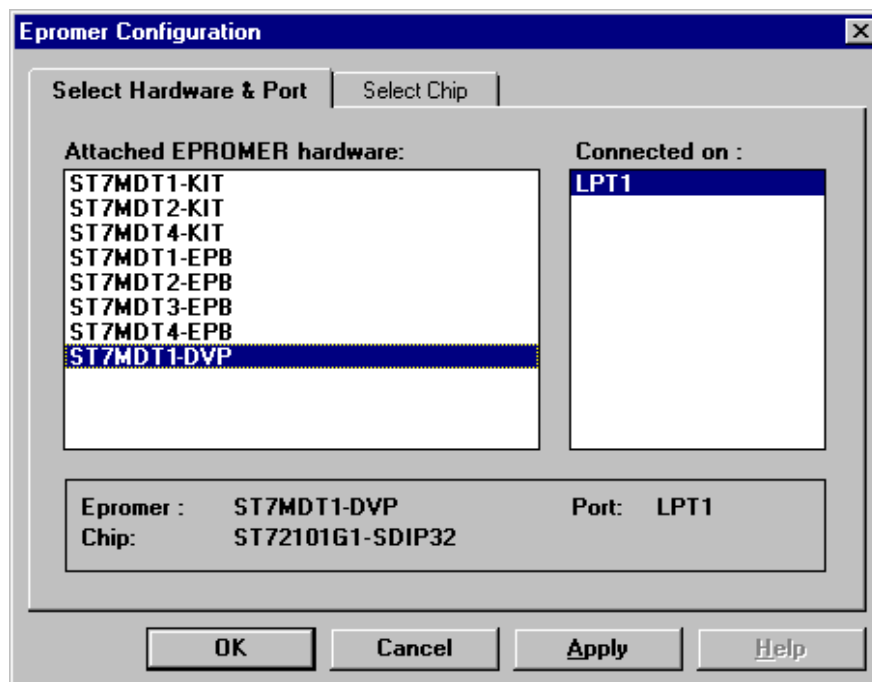

2   2In the list, select the programming board for this ST7MDT1-DVP Development Kit:
ST7MDT1-DVP

3   Click the *Select Chip* tab to display the list of the devices that can be programmed
with this ST7MDT1-DVP Development Kit.

The list box shown below appears.

Epromer Configuration ☒

| Select Hardware & Port | **Select Chip** |

Chip plugged in :

```
ST72101G1-SDIP32
ST72101G2-SDIP32
ST72212G2-SDIP32
ST72213G1-SDIP32
ST72251G1-SDIP32
ST72251G2-SDIP32
```

| Epromer: | ST7MDT1-DVP | Port: | LPT1 |
| Chip: | ST72101G1-SDIP32 | | |

| **OK** | **Cancel** | Apply | Help |

4   In the list, select the device to be programmed:

ST72101G1 or G2

ST72212G2

ST72213G1

ST72251G1 or G2

Click **OK** to confirm. The list box closes.

The memory mapping of the specified device now appears in the display area of the main window. It is made up of "FFs", as one may expect, since programming has not taken place yet.

To view in turn the memory mapping of a selection of devices plugged in, open the configuration window again, then the *Select Chip* list box, and click **Apply**. The display area of the main window changes while the list box stays open, for you to choose another chip if necessary.

The name of the device to be programmed
is displayed here

For more information on how to use the Windows Epromer, click the **Help** command in
the main menu bar.

4 HARDWARE FEATURES

4.1 Emulator

4.1.1 General Layout
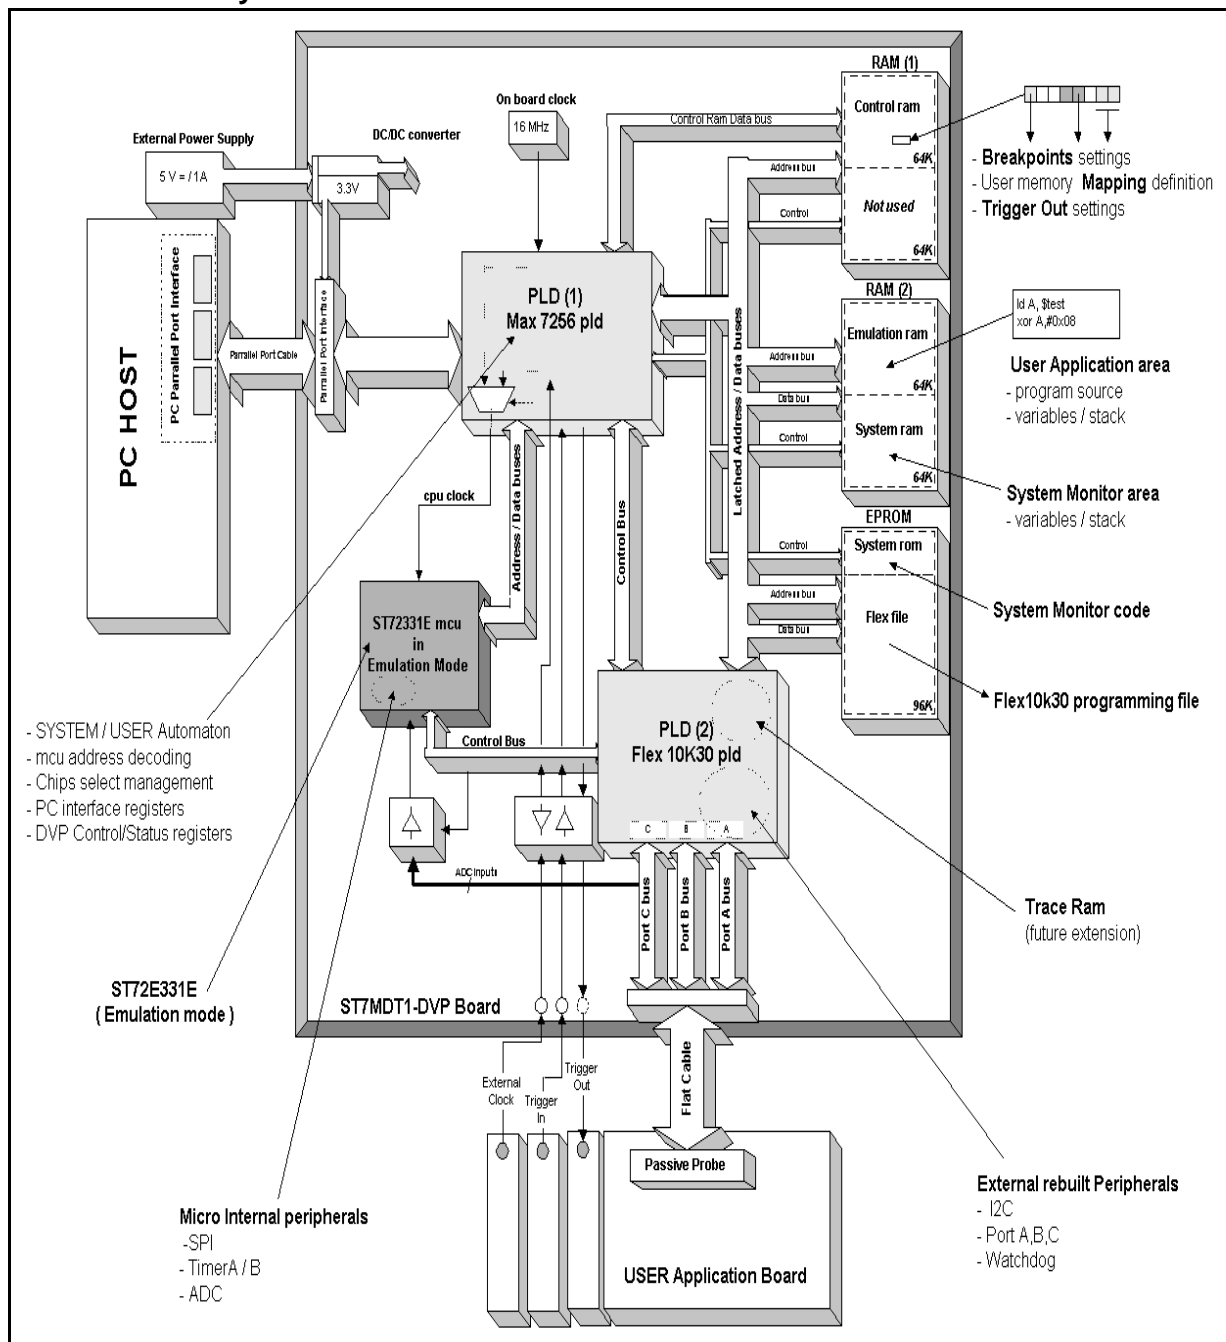

4.1.2 CPU

The board is equipped with an ST72331E CPU that can operate in two different modes: the USER mode and the SYSTEM mode.

When in USER mode, the CPU is entirely devoted to the processing of your application code.
Specifying the target microcontroller

It therefore behaves as the CPU of the target microcontroller you specified beforehand, via the appropriate debugger command sequence:

- **WGDB7 Main Menu**

- **Commands** menu

- **Micro Name** command

(see **Windows Debugger for the ST7 Family, User Manual**).

When your application program is running the LD1 red LED lights up.

When in SYSTEM mode, the CPU is used to execute all other tasks.

When you select a command in the main menu of the debugger, you cause the CPU to automatically switch from one mode to the other.

Selecting any of these commands in the Windows Debugger main window causes the CPU to switch to the USER mode.

Selecting this command causes the CPU to switch to the SYSTEM mode.

All other Windows Debugger commands execute in SYSTEM mode only.
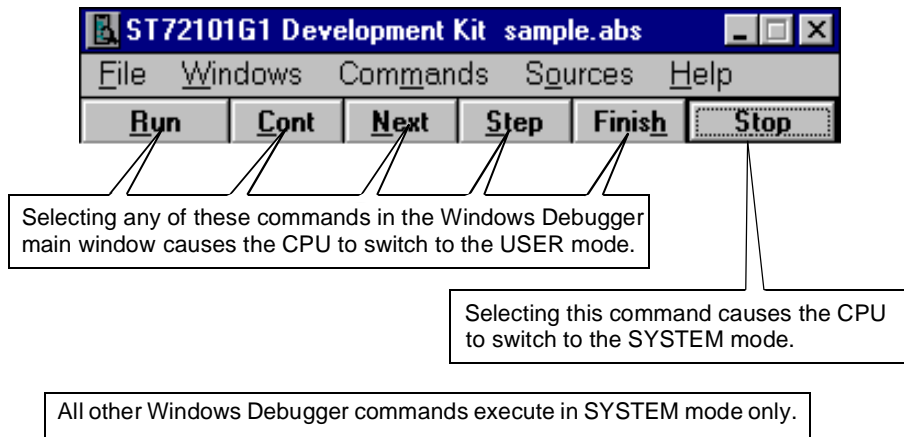

4.1.3 Clock

The development board is shipped with a 16-MHz (TTL) internal clock.

You may also use an external clock (TTL-compatible, max 16 MHz) whose signal is supplied via the mini wrapping pin "CLOCKIN" located on the board next to the passive probe flat connector (ref.: TP18).

Caution:

In **normal mode** (Miscellaneous Register slow mode bit = 0), acceptable CLOCKIN frequencies can take any value between 16 MHz and 250 kHz.
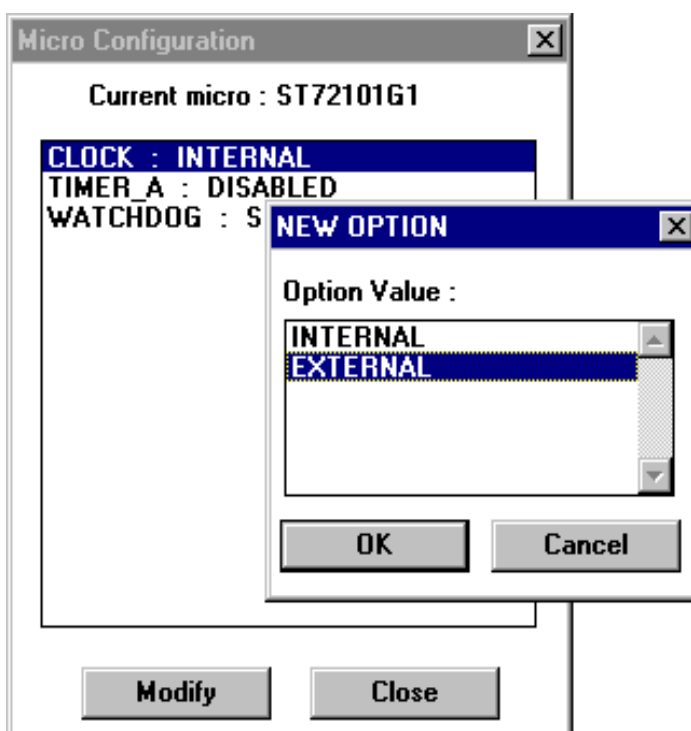

In **slow mode** (Miscellaneous Register slow mode bit = 1), the CLOCKIN frequency must take values between 16 Mhz and 8 Mhz.

Note that the board cannot operate with clock signals received from the application board via the OSCIN pin of the probe. You must use the CLOCKIN inlet instead.

By contrast, the application board can use the development board clock via the OSCOUT pin of the probe. In this case you must place a solder spot on G2 (see Table 4, "Probe Pin Assignment (SDIP32)," on page 32).

A debugger dialog box lets you choose the clock type (**internal** or **external**) as a microcontroller configuration option.

You access these dialog boxes via the following debugger command sequence:

 - **WGDB7 Main Menu**

 - **Command**s menu

 - **Micro Configuration** command

(see **Windows Debugger for the ST7 Family, User Manual**).

4.1.4 Memory
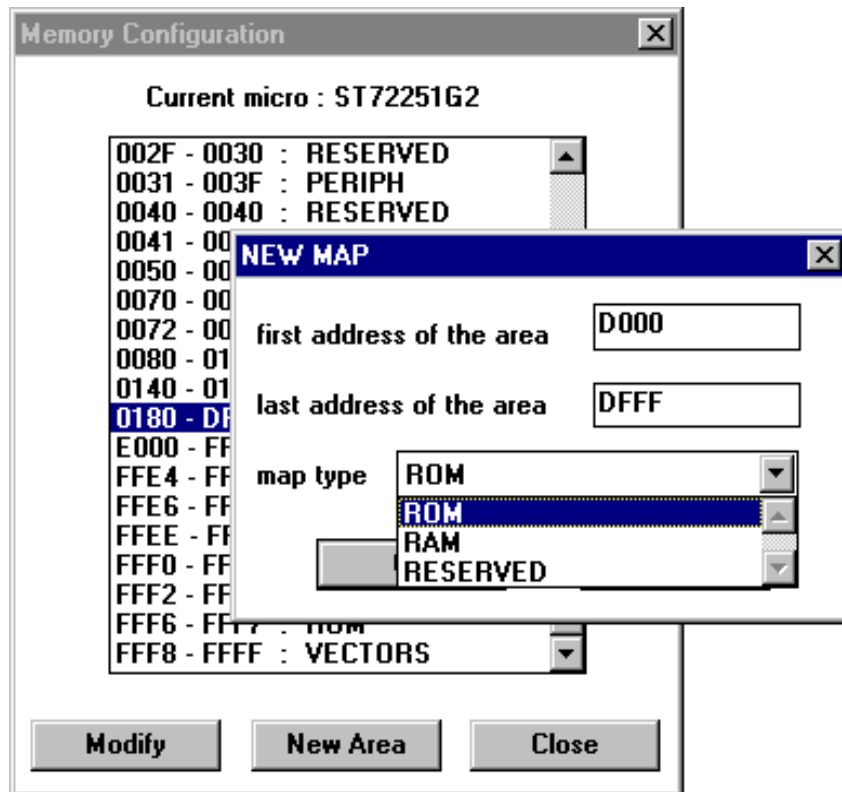

The memory mapping for the emulated device is also configurable. You access this dialog boxes via the following debugger command sequence:

- *WGDB7 Main Menu*

- *Command*s menu

- *Memory Configuration* command

(see *Windows Debugger for the ST7 Family, User Manual*).

This feature would enable you, for instance, to temporarily increase the ROM size during the development phase of your application.

In the example, a R0M area has been mapped to the D000h-DFFFh part of a reserved area (0180h-DFFFh) for the target device (ST72212G2).

4.1.5 On-Chip Peripherals

Parallel I/O Ports

22 bidirectional parallel I/O lines with interrupts are supported. The I/O lines can be shared between other on-chip peripherals (alternate functions) and any general purpose I/O function defined by the application. Data is input and output via data registers (one for each port). Data Direction and Option registers allow each line to be individually configured to the application's requirements.

16-Bit Timers

Two 16-bit timers, Timer A and Timer B, are available (ST72212 G2 and ST7225 G1/G2 only; the other devices supported by the ST7MDT1-DVP Development Kit use Timer A only). They consist of a 16-bit free-running counter driven by a programmable prescaler. Both timers feature output compare, pulse width modulation (PWM) and input capture functions with associated registers. This allows applications to measure pulse intervals or generate pulse wave-

forms. Timer overflow and other events are flagged in a status register with optional interrupt generation.

A debugger dialog box lets you enable/disable the clocks for timer A or timer B as a microcontroller configuration option.

When the DISABLED option is chosen, the timer is frozen as long as the CPU operates in SYSTEM mode. For instance, you would use this option to check whether the timer has reached a specified value.

When the ENABLED option is chosen, the timer is continuously operating even in SYSTEM mode. An example of use of this option is for an application in which the PWM (pulse width modulation) output of the timer drives a motor that must keep running.
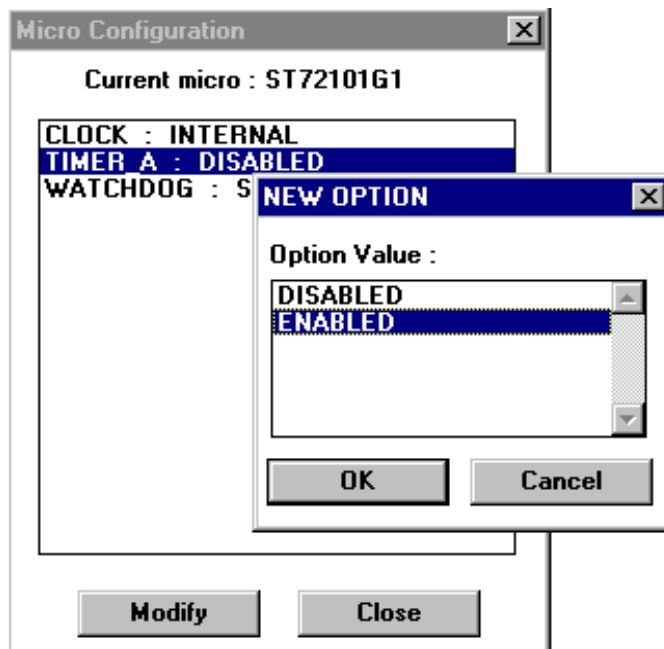

Analog to Digital Converter

The ADC peripheral multiplexes up to 8 analog input channels. It converts the analog input to 8-bit value using monotonic successive approximation. The analog input voltage must lie within the supply voltage range, which is used as the analog reference.

SPI Serial Peripheral Interface

The SPI peripheral is a synchronous serial interface for Master and Slave device communications. Single master and multimaster mode systems are supported for communication with external peripherals or other microprocessors. Dedicated registers and interrupts allow full software control and user defined protocols.

Watchdog Timer

The watchdog timer consists of a 7-bit reloadable downcounter that triggers a device reset if it reaches a predefined value.

During normal operation, the application reloads the counter at regular intervals to prevent a reset occurring. By this means, if the application hangs, the condition is automatically cleared by resetting the MCU.

The watchdog timer can be enabled by software or by hardware. The choice is a microcontroller configuration option.
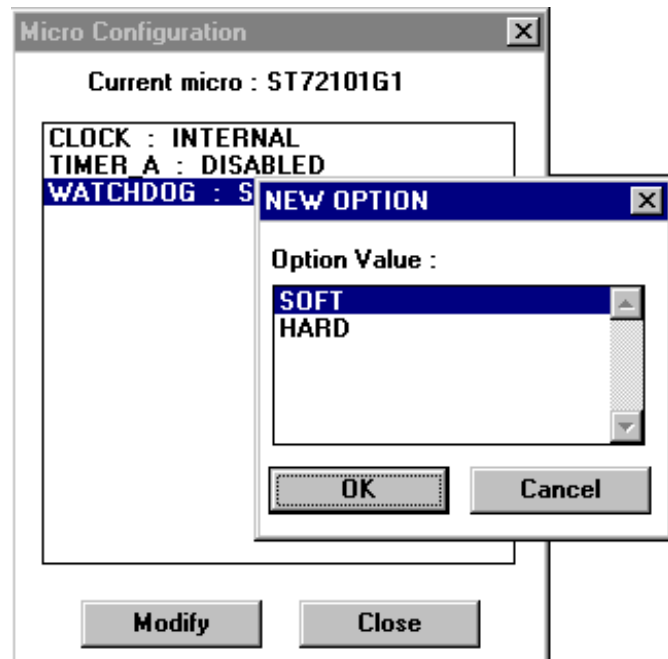

I 2 C Bus Interface

The I 2 C bus is a synchronous serial bus for connecting multiple devices using a data line and a clock line. The ST7 I 2 C interface operates in multimaster or slave mode and supports speeds of up to 400 KHz. Bus events (Bus busy, slave address recognised) and error conditions are automatically flagged in peripheral registers and interrupts are optionally generated. The interface supports 7 and 10-bit addressing.

4.1.6 Hardware Breakpoint Capabilities

With the ST7MDT1-DVP Development Kit you can define hardware breakpoints that cause your program to stop whenever a defined event occurs. An event can be:

- The occurrence of a memory access via a read operation

- The occurrence of a memory access via a write operation

- The occurrence of an opcode fetch

- The occurrence of a write operation in a write-protected location

- The occurrence of a write operation in a reserved location

- The occurrence of a stack overflow/underflow

- The occurrence of an access to a reserved memory area

- The occurrence of a external input signal (triggered break feature). The signal is conveyed via a mini wrapping pin located on the board next to the passive probe flat connector.

4.1.7 Input Trigger

The evaluation board of the ST7MDT1-DVP Development Kit provides a special inlet (TRI-GIN, Ref.:TP18) that can be used to transmit a signal to stop the execution of your application upon the occurrence of an external event. In this case, the program is stopped after the execution of the current instruction.

The corresponding diagram is as follows:
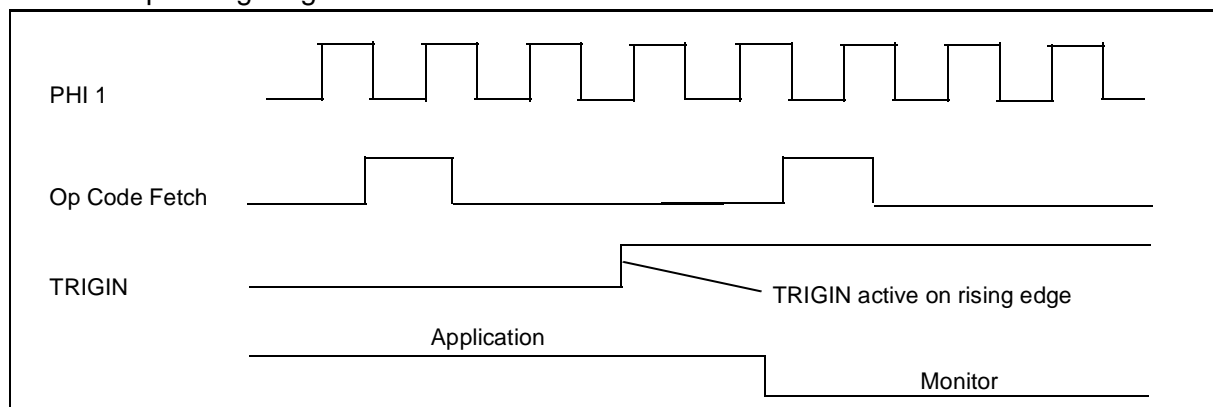

A debugger dialog box lets you choose the waveform mode for the external signal (**Pulse mode** or **Windows mode**) as a microcontroller configuration option (see **Windows Debugger for the ST7 Family, User Manual**).

4.1.8 External Output Trigger

The evaluation board of the ST7MDT-DVP Development Kit features a special outlet through which an external signal can be triggered out. The signal is conveyed via a mini wrapping pin located on the board next to the passive probe flat connector (ref.: TP16).

A debugger dialog box lets you choose the waveform mode for the external signal (**Pulse mode** or **Windows mode**) as a microcontroller configuration option (see **Windows Debugger for the ST7 Family, User Manual**).

4.2 Connection to External User Resources

4.2.1 Pin Description

You may connect an application board to the ST7MDT-DVP Development Kit evaluation board for evaluation or debugging in linked emulation mode. The P3 connector in the evaluation board provides all the I/O pins needed for the communication. Signals are transmitted via a passive probe to be plugged in the application board at the location of the emulated device.

Table 2 shows the pin assignment for the P3 connector (evaluation board) and the probe (application board).

Table 3. P3 Pin Assignment for Probe Connection (34-pin HE10)

Description	P3 pin No.	P3 pin No.	Description
Application Reset	1	2	Application Vcc
Ground	3	4	A0 Port
OSCOUT	5	6	A1 Port
Ground	7	8	A2 Port
B7 Port	9	10	A3 Port
B6 Port	11	12	Ground
B5 Port	13	14	A4 Port
B4 Port	15	16	Ground
B3 Port	17	18	A5 Port
B2 Port	19	20	Ground
B1 Port	21	22	A6 Port

C4 Port	27	28	C0 Port
C3 Port	29	30	C1 Port
Ground	31	32	Ground
Ground	33	34	C2 Port

Table 4. Probe Pin Assignment (SDIP32)

Pin name/Description	Probe pin No.	Probe pin No.	Pin Name/Description
RESET	1	17	C2 Port
Not used (OSCIN)	2	18	C1 Port
OSCOUT (*)	3	19	C0 Port
B7 Port	4	20	A7 Port
B6 Port	5	21	A6 Port
B5 Port	6	22	A5 Port
B4 Port	7	23	A4 Port
Not used	8	24	Not used
Not used	9	25	Not used
B3 Port	10	26	A3 Port
B2 Port	11	27	A2 Port
B1 Port	12	28	A1 Port
B0 Port	13	29	A0 Port
C5 Port	14	30	Not used (VPPTEST)
C4 Port	15	31	VSS (Ground)
C3 Port	16	32	VDD (**)

(*) The emulator clock is connected to OSCOUT only when a solder spot is placed in G2 on the evaluation board.

(**) Application voltage: 4.5 to 5.5 V only.

4.2.2 Supplying the Application Board

There are two ways in which you may supply your application board directly from the evaluation board:

1 By using the two test pins located in TP14 (GND) and TP15 (5V) on the evaluation board. Then the current should not exceed 100 mA.

2 Via the VDD pin in the P3 probe connector, after a solder spot has been placed in G1 on the evaluation board. This method is not recommended.

4.2.3 Limitations

• The minimum CPU operating internal frequency of the development board is 250 kHz (for more details, see "Clock" on page 26.

• The application supply voltage should take a value between 4.5 and 5.5 V, different from the 3-6 V range for the devices.

• If any of the PB1 or PC1 ports are to be used for a PWM output it is recommended to insert an FCT circuit between the output pin and the application side, as in the following example:
CAUTION

Electrical levels and behaviour on I/O port pins depend on the technology used in the PLD (Programmable Logic Device) referred to as EPF 10K30 on the development board. The technology used is TTL-compatible, different from the ST72251 chip technology (CMOS). Consequently, electrical high state levels on I/O pins are limited to 3.3 V.

4.3 Device Programmer

4.3.1 General Layout
4.3.2 Targets

The evaluation board provides you with the necessary resources to program an ST7 device belonging to the ST72251G2 series: ST72101G1 or G2, ST72251G1 or G2, ST72213G1, or ST72212G2.

The sample device supplied with the ST7MDT1-DVP Development Kit is accommodated by the SDIP32 Zero Insertion Force (ZIF) socket mounted on the board (Ref.: U19).

4.4 Link to PC

The ST7MDT1-DVP Development Kit evaluation board communicates with your PC via the P2 connector connected to the PC parallel port (LPT1 or LPT2).

NOTE: The parallel port of your PC should have been configured as a **Centronics** parallel

port (BIOS settings). The Development Kit does not support EPP, ECP or bidirectional parallel port configurations.

4.5 Power Supply

A plug-in power supply pack is supplied with the ST7MDT1-DVP Development Kit to be connected to the P1 female jack connector. This power supply must be plugged into the appropriate AC source. Specific sales types indicate the corresponding mains AC voltage supported: 220V, 110V (US), or 240V (UK).

Provided DC power specifications are as follow:

Voltage: 5 V

Current: 1 A

A complementary power supply inlet (ref. JP1) is provided with the same specifications. When using this power supply, take care of the polarities marked nearby the two-point connector.

5 SOFTWARE FEATURES

5.1 Tools

To help you design, code and debug your applications, and program them on chip, the following software has been included in the ST7MDT1-DVP Development Kit:

• ST Assembly Chain

• ST7 Simulator

• ST7 Windows Debugger

• Epromer for ST7 MCUs

A stand-alone ST7 instruction help file is also available. In many circumstances, it will help you select the most suitable code for your programs and improve the overall performance of your applications.

5.2 ST Assembly Chain for ST7 Family

The ST Assembly Chain is a cross development system for ST7-driven applications. It includes an assembler, a linker, a formatter and a librarian.

The information flow is summarized in the chart below:
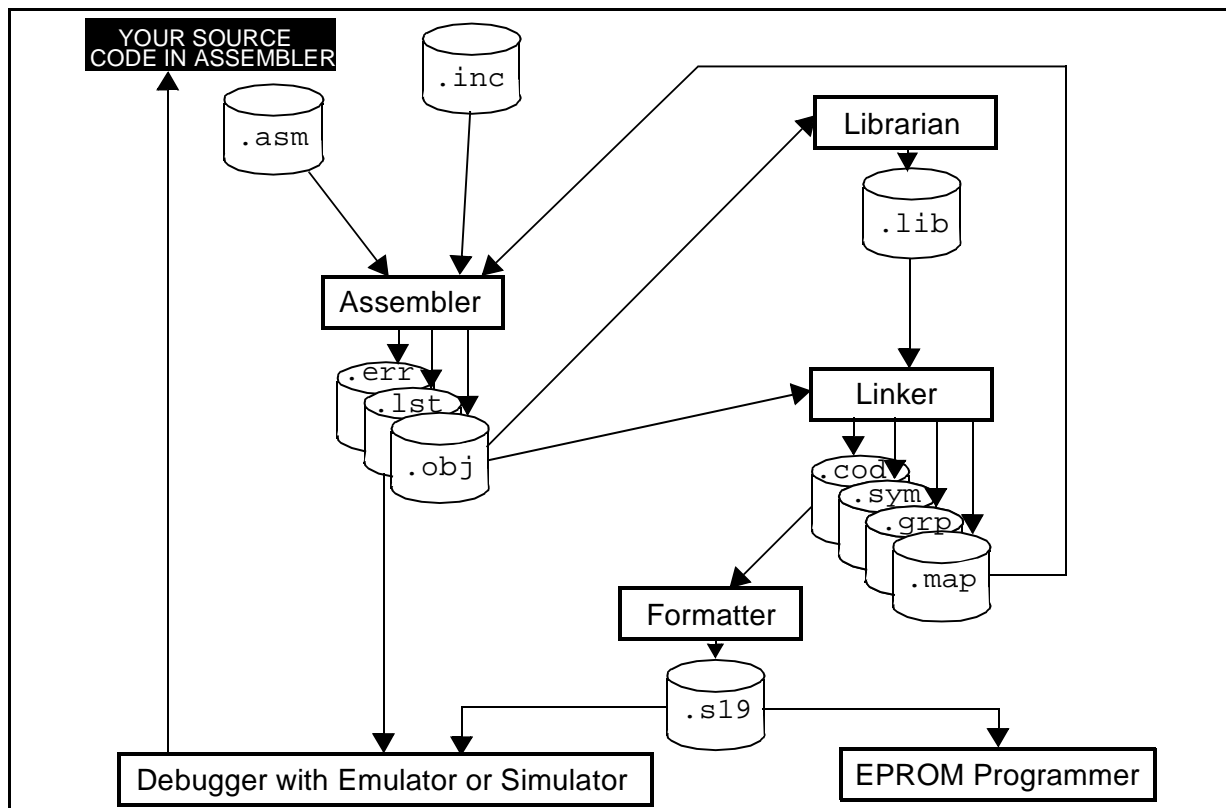

For more information about the components of the ST7 Assembly Chain refer to the ***Software Tools for the ST7 Family*** User Manual.

5.3 Hiware C Compiler Demonstration Chain

The **Hiware C Compiler Chain** for ST7 is also available. It makes it possible to develop applications that will be run, debugged at source level, or programmed using the Development Kit.

A demonstration version of the **Hiware C Compiler Chain** is included in the ST7MDT1-DVP Development Kit package for evaluation purpose only.

5.4 ST7 Simulator

The **ST7 Simulator** is a *program* that **simulates** the execution of ST7 programs, instruction by instruction. The behaviour of the peripherals is also simulated.

Note that, in this case, no external hardware is required. You may then debug any of your programs without using the evaluation board of the ST7MDT1-DVP Development Kit.

5.5 ST7 Windows Debugger

You can run the WGDB7 debugger using either of the following:

ST7 Simulator,

ST7 Emulator,

ST7 Development Kit.
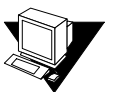

Simulation-aided debugging lets you develop and test your application(s) before your hardware is finished or available. This could save time and provide you with some flexibility regarding your own application development plans. Also, this debugging method relieves you from any premature, undesirable, hardware dependency. Lastly, this is the cheapest solution.

Some real-time debugging features such as the tracing facility and the logic analyser function are not available either. Nevertheless, you will benefit from new other features such as time measurement, and time-dependent break management.
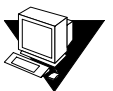

Emulation-aided debugging lets you also develop and test your application(s) long before your hardware is finished or available. Although it is more hardware-dependent than the simulation option, because emulators have components specific to various microcontroller families, it presents the major advantage of supporting real-time testing and debugging in the user application board environment. Also, it supports the tracing and logic analyser debugging features that can be used in conjunction with the emulators.

The **Development Kit** and the **Emulator** debugging capabilities are very close. Compared with the Simulator and the Emulator, the Development Kit shows some differences, however, summarized in the following table:.

Table 5. **Development Kit, Emulator and Simulator Debugging Features**

Description	Debugger+DEVKIT	Debugger+EMU	Debugger+SIMU
Hardware Test	YES	YES	NO
Loading Programs, Viewing Program Details	YES	YES	YES
Executing Loaded Programs	YES	YES	YES
Managing Software Breakpoints	YES	YES	YES
Managing Hardware Breakpoints	YES	YES	YES
Viewing ST7 Resources	YES	YES	YES
Viewing Disassembled Program Code	YES	YES	YES
Viewing Register Contents	YES	YES	YES
Watching Symbols, Types of Variables, Expressions	YES	YES	YES
Entering, Assembling Mnemonics to Emu /Simu ST7 Memory	YES	YES	YES
Using GDB7 Commands	YES	YES	YES
Choosing Emulated/Simulated ST7 Micro Name	YES	YES	YES
Changing ST7 Emulated/Simulated Memory Mapping	YES	YES	YES
Displaying and Modifying Configuration Options	YES	YES	YES
Customising the Debugger	YES	YES	YES
Working with Trace Buffer	NO	YES	NO
Accessing Logic Analyser Information	NO	YES	NO

Table 5. Development Kit, Emulator and Simulator Debugging Features

Description	Debugger+DEVKIT	Debugger+EMU	Debugger+SIMU
Simulating Pin Input/Output Signals	n.a.	n.a.	YES
Time Management	NO	NO	YES
Output Trigger Management	YES	YES	NO
Stack Overflow/Underflow Stop	YES	NO	NO
Non-existent Memory Stop	YES	NO	NO
Write Protect Memory Stop	YES	NO	NO
Input Trigger Stop	YES	NO	NO

Fore more information on how to debug with any of the above tools, see **Windows Debugger for the ST7 Family, User Manual**.

5.6 Epromer for ST7 MCUs

Epromer is a Windows interface that lets you:

- View, edit and save executable files in the Hex (Intel) and .S19 (Motorola) formats, generated by the Assembler, Linker or C Compiler for ST microcontrollers.
- Program executable files into ST microcontrollers.
- View and verify a microcontroller's memory contents.

Note that Epromer is not device dependent.

Fore more information on how to use Epromer, See "Programming ST7 Devices" on page 27.
