

# PA7140 PEEL™ Array

## Programmable Electrically Erasable Logic Array

### Features

- CMOS Electrically Erasable Technology
  - Reprogrammable in 40-pin DIP and 44-pin PLCC packages
- Versatile Logic Array Architecture
  - 24 I/Os, 14 inputs, 60 registers/latches
  - Up to 72 logic cell output functions
  - PLA structure with true product-term sharing
  - Logic functions and registers can be I/O-buried
- Flexible Logic Cell
  - Up to 3 output functions per logic cell
  - D, T and JK registers with special features
  - Independent or global clocks, resets, presets, clock polarity, and output enables
  - Sum-of-products logic for output enables

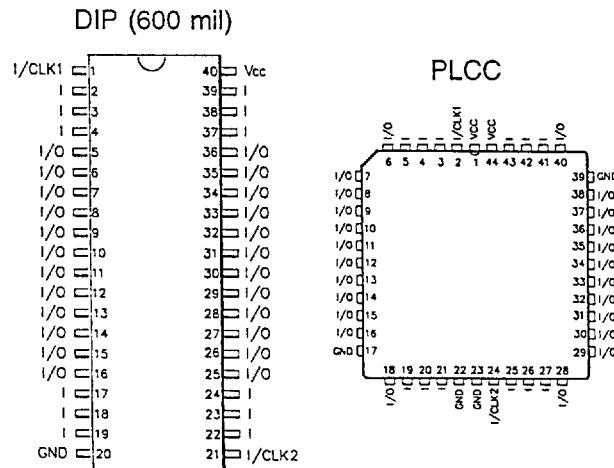

- High-Speed, Moderate Power Consumption
  - As fast as 13ns/20ns (tpdi/tpd), 66.6MHz fmax
  - ICC 100mA max, 80mA typical
- Ideal for Combinatorial, Synchronous and Asynchronous Logic Applications
  - Integration of multiple PLDs and random logic
  - Buried counters, complex state-machines
  - Comparitors, decoders, multiplexers and other wide-gate functions
- Development and Programmer Support
  - ICT PLACE Development Software
  - Fitters for ABEL and CUPL design software
  - Programming support by ICT PDS-3 and other popular 3rd party programmers

### General Description

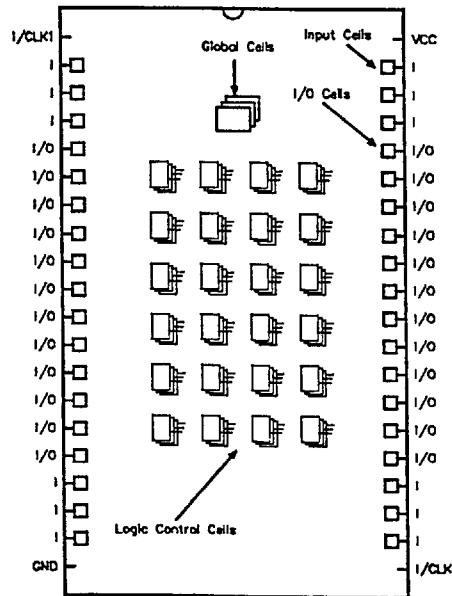

The PA7140 is a member of the Programmable Electrically Erasable Logic (PEEL) Array family based on ICT's 1-micron CMOS EEPROM technology. PEEL Arrays free designers from the limitations of ordinary PLDs by providing the architectural flexibility and speed needed for today's programmable logic designs. The PA7140 offers a versatile logic array architecture with 24 I/O pins, 14 input pins and 60 registers/latches (24 buried logic cells, 12 input reg/latches, 24 buried I/O reg/latches). Its logic array implements 100 sum-of-product logic functions divided into two groups each serving 12 logic cells. Each group shares half (60) of the 120 product-terms available for logic cells.

The PA7140's logic and I/O cells (LCCs, IOCs) are extremely flexible with up to three output functions per cell (a total of 72 for all 24 logic cells). Cells are configurable as D, T and JK registers with independent or global clocks, resets, presets, clock polarity, and other features, making the PA7140 suitable for a variety of combinatorial, synchronous, and asynchronous logic applications. The PA7140 supports speeds as fast as 13ns/20ns (tpdi/tpd) and 66.6MHz (fmax) at moderate power consumption 100mA (80mA typical). Packaging includes 40-pin DIP, and 44-pin PLCC. Development and programming support for the PA7140 is provided by ICT and popular third party development tool manufacturers.

## Absolute Maximum Ratings

Exposure to absolute maximum ratings over extended periods of time may affect device reliability. Exceeding absolute maximum ratings may cause permanent damage

Symbol	Parameter	Conditions	Rating	Unit
Vcc	Supply Voltage	Relative to GND	- 0.5 to + 7.0	V
VI, VO	Voltage Applied to Any Pin	Relative to GND <sup>1</sup>	- 0.5 to Vcc + 0.6	V
Io	Output Current	Per pin (IOL, IOH)	± 25	mA
TST	Storage Temperature		- 65 to + 150	°C
TLT	Lead Temperature	(Soldering 10 seconds)	+ 300	°C

## Operating Ranges

Symbol	Parameter	Conditions	Min	Max	Unit
Vcc	Supply Voltage	Commercial <sup>2</sup>	4.75	5.25	V
TA	Ambient Temperature	Commercial <sup>2</sup>	0	+ 70	°C
TR	Clock Rise Time	(Note 3)		20	ns
TF	Clock Fall Time	(Note 3)		20	ns
TRVCC	Vcc Rise Time	(Note 3)		250	ms

## D.C. Electrical Characteristics

Over the operating range

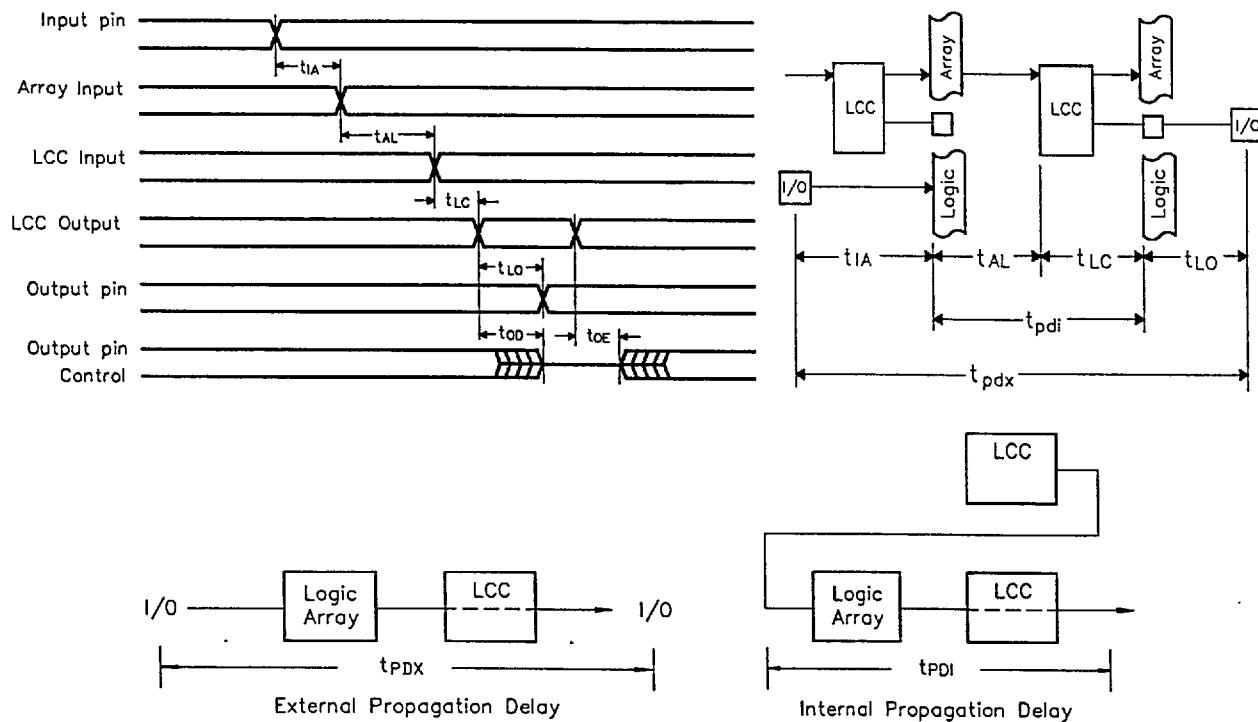

Symbol	Parameter	Conditions	Min	Max	Unit
VOH	Output HIGH Voltage - TTL	Vcc = Min, IOH = - 4.0mA	2.4		V
VOHC	Output HIGH Voltage-CMOS	Vcc = Min, IOH = - 10µA	Vcc - 0.1		V
VOL	Output LOW Voltage - TTL	Vcc = Min, IOL = 16mA		0.5	V
VOLC	Output LOW Voltage-CMOS	Vcc = Min, IOL = 10µA		0.1	V
VIH	Input HIGH Level		2.0	Vcc + 0.3	V
Vil	Input LOW Level		- 0.3	0.8	V
IIL	Input Leakage Current	Vcc = Max, GND ≤ VIN ≤ Vcc		±10	µA
Ioz	Output Leakage Current	I/O = High-Z, GND ≤ VO ≤ Vcc		±10	µA
Isc	Output Short Circuit Current <sup>5</sup>	Vcc=5V, VO=0.5V, TA=25°C	- 30	- 120	mA
Icc	Vcc Current	VIN = 0V or Vcc <sup>4,12</sup> f = 25MHz All outputs disabled		100 (typ=80) <sup>20</sup>	mA
CIN	Input Capacitance <sup>6</sup>	TA = 25°C, Vcc = 5.0V @ f = 1MHz		6	pF
COUT	Output Capacitance <sup>6</sup>			12	pF

## A.C. Electrical Characteristics Combinatorial

Over operating conditions

Symbol	Parameters <sup>7, 13</sup>	PA7140-20 PA7140-1 <sup>18</sup>		PA7140-25 PA7140-2 <sup>18</sup>		Units
		Min	Max	Min	Max	
t <sub>PDI</sub>	Propagation delay Internal (t <sub>AL</sub> + t <sub>LC</sub> )		13		17	ns
t <sub>PDX</sub>	Propagation delay External (t <sub>IA</sub> + t <sub>AL</sub> + t <sub>LC</sub> + t <sub>LO</sub> )		20		25	ns
t <sub>IA</sub>	Input or I/O pin to array input		2		2	ns
t <sub>AL</sub>	Array input to LCC		12		16	ns
t <sub>LC</sub>	LCC input to LCC output <sup>11</sup>		1		1	ns
t <sub>LO</sub>	LCC output to output pin		5		6	ns
t <sub>OD, TOE</sub>	Output Disable, Enable from LCC output <sup>8</sup>		5		6	ns
t <sub>ox</sub>	Output Disable, Enable from input pin <sup>8</sup>		20		25	ns

f <sub>MAX4</sub>	Max system-clock frequency Ext/Ext 1/(t <sub>SCX</sub> + t <sub>COX</sub> )		45.4		35.7	MHz
f <sub>TGL</sub>	Max system-clock toggle frequency 1/(t <sub>CW</sub> + t <sub>CW</sub> ) <sup>10</sup>		71.4		62.5	MHz
t <sub>PR</sub>	LCC Preset/Reset to LCC output		1		2	ns
t <sub>ST</sub>	Input to Global Cell preset/reset (t <sub>IA</sub> + t <sub>AL</sub> + t <sub>PR</sub> )		15		20	ns
t <sub>AW</sub>	Asynch. preset/reset pulse width	8		8		ns
t <sub>RT</sub>	Input to LCC Reg-Type (RT)		8		10	ns
t <sub>RTV</sub>	LCC Reg-Type to LCC output register change		1		2	ns
t <sub>RTC</sub>	Input to Global Cell reg.-type change (t <sub>RT</sub> + t <sub>RTV</sub> )		9		12	ns
t <sub>RW</sub>	Asynch. Reg-Type pulse width	10		10		ns
t <sub>reset</sub>	Power-on reset time for register in clear state <sup>3</sup>		5		5	μs

## Sequential Timing - Waveforms and Block Diagram

### Notes:

- Minimum DC input is – 0.5V, however inputs may undershoot to – 2.0V for periods less than 20ns.
- Contact ICT for other operating ranges.
- Test points for Clock and Vcc in  $t_R$ ,  $t_F$ ,  $t_{CL}$ ,  $t_{CH}$ , and  $t_{RESET}$  are referenced at 10% and 90% levels.
- I/O pins are 0V or VCC.
- Test one output at a time for a duration of less than 1 sec.
- Capacitances are tested on a sample basis.
- Test conditions assume: signal transition times of 5ns or less from the 10% and 90% points, timing reference levels of 1.5V (unless otherwise specified).
- $t_{OE}$  is measured from input transition to  $VREF \pm 0.1V$  (See test loads at end of section 5 for  $VREF$  value).  $t_{OD}$  is measured from input transition to  $VOH - 0.1V$  or  $VOL + 0.1V$ .
- DIP: "System-clock" refers to pin 1/21 high speed clocks. PLCC: "System-clock" refers to pin 2/24 high speed clocks.
- For T or JK registers in toggle (divide by 2) operation only.
- For combinatorial and async-clock to LCC output delay.
- ICC for a typical application: This parameter is tested with the device programmed as a 12-bit D type Counter.
- Test loads are specified at the end of section 3 in this data book.
- "Async. clock" refers to the clock from the Sum term (OR gate).
- The "LCC" term indicates that the timing parameter is applied to the LCC register.
- The "IOC" term indicates that the timing parameter is applied to the IOC register.
- The "INC" term indicates that the timing parameter is applied to the INC register.
- The "IOC/INC" term indicates that the timing parameter is applied to both the IOC and INC registers.
- The "LCC/IOC/INC" term indicates that the timing parameter is applied to the LCC, IOC and INC registers.
- This refers to the Sum-D gate routed to the IOC register for an additional buried register.
- The term "Input" without any reference to another term refers to an (external) input pin.
- PA7140-1 is an alternate number for PA7140-20. PA7140-2 is an alternate number for PA7140-25.
- The parameter  $t_{SPi}$  indicates that the PCLK signal to the IOC register is always slower than the data from the pin or input by the absolute value of  $(t_{SK} - t_{PK} - t_{IA})$ . This means that no set-up time for the data from the pin or input is required, i.e. the external data and clock can be sent to the device simultaneously. Additionally, the data from the pin must remain stable for  $t_{HPi}$  time, i.e. to wait for the PCLK signal to arrive at the IOC register.
- Typical (typ) ICC is measured at  $TA = 25^\circ C$ , Freq = 25MHz,  $VCC = 5V$ .
