Description

The IBM11D8360B is a 32MB industry standard 72-pin 4-byte single in-line memory module (SIMM). The module is organized as an 8Mx36 high speed memory array, and is configured as two 4Mx36 banks -each independently selectable via unique $\overline{RAS}$ inputs. The assembly is intended for use in 18, 36 and 72 bit parity applications. It is manufactured with sixteen 4Mx4 devices, each in a 300mil package, and eight 4Mx1 devices in a 300mil package. The module is compatible with the JEDEC 72-Pin SIMM standard. Two package offerings are avail-

able to accomodate system spacing requirements. The IBM11D4360B is a 16MB populated version, manufactured with eight 4Mx4 devices and four 4Mx1 devices.

The IBM 72-Pin SIMMs provide a high performance, flexible 4-byte interface in a 4.25" long footprint. Related products include the 8Mx32 non-parity SIMM, IBM11D8320B, as well as other density offerings.

1. I_{CC1}, I_{CC3}, I_{CC4} and I_{CC6} depend on cycle rate.
2. I_{CC1}, I_{CC4} depend on output loading. Specified values are obtained with the output open.
3. Address can be changed once or less while $\overline{\text{RAS}} = V_{IL}$. In the case of I_{CC4}, it can be changed once or less when $\overline{\text{CAS}} = V_{IH}$.
4. Refresh current is specified for 1 bank active and 1 bank standby.

AC Characteristics ($T_A = 0$ to $+70^\circ\text{C}$, $V_{CC} = 5 \pm 0.5\text{V}$)

1. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} .
2. An initial pause of 200 μs is required after power-up followed by 8 $\overline{\text{RAS}}$ only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 CAS before $\overline{\text{RAS}}$ refresh cycles instead of 8 $\overline{\text{RAS}}$ only refresh cycles is required.
3. AC measurements assume $t_T = 5\text{ns}$.
