AT27BV020

Features

- Fast Read Access Time 100 ns
- **Dual Voltage Range Operation** Unregulated Battery Power Supply Range, 2.7V to 3.6V or Standard 5V ± 10% Supply Range
- Compatible with JEDEC Standard AT27C020
- Low Power CMOS Operation 20 $\,\mu\text{A}$ max. (less than 1 μA typical) Standby for Vcc = 3.6V 29 mW max. Active at 5 MHz for Vcc = 3.6V
- Wide Selection of JEDEC Standard Packages 32-Lead PLCC
 - 32-Lead TSOP
- **High Reliability CMOS Technology** 2,000V ESD Protection 200 mA Latchup Immunity
- Rapid[™] Programming Algorithm 100 µs/byte (typical)
- **CMOS and TTL Compatible Inputs and Outputs**
- JEDEC Standard for LVTTL and LVBO Integrated Product Identification Code
- **Commercial and Industrial Temperature Ranges** ۰

Description

The AT27BV020 is a high performance, low power, low voltage 2,097,152 bit onetime programmable read only memory (OTP EPROM) organized as 256K by 8 bits. It requires only one supply in the range of 2.7 to 3.6V in normal read mode operation, making it ideal for fast, portable systems using either regulated or unregulated battery power.

Atmel's innovative design techniques provide fast speeds that rival 5V parts while keeping the low power consumption of a 3V supply. At Vcc = 2.7V, any byte can be accessed in less than 100 ns. With a typical power dissipation of only 18 mW at 5 MHz and V_{CC} = 3V, the AT27BV020 consumes less than one fifth the power of a standard 5V EPROM. Standby mode supply current is typically less than 1 μA at 3V. The AT27BV020 simplifies system design and stretches battery lifetime even further by eliminating the need for power supply regulation.

Description (Continued)

The AT27BV020 is available in industry standard JEDEC approved one-time programmable (OTP) plastic PLCC and TSOP packages. All devices feature two-line control (\overrightarrow{CE} , \overrightarrow{OE}) to give designers the flexibility to prevent bus contention.

The AT27BV020 operating with V_{CC} at 3.0V produces TTL level outputs that are compatible with standard TTL logic devices operating at V_{CC} = 5.0V. At V_{CC} = 2.7V, the part is compatible with JEDEC approved low voltage battery operation (LVBO) interface specifications. The device is also capable of standard 5-volt operation making it ideally suited for dual supply range systems or card products that are pluggable in both 3-volt and 5-volt hosts.

Atmel's AT27BV020 has additional features to ensure high quality and efficient production use. The Rapid[™] Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 µs/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages. The AT27BV020 programs exactly the same way as a standard 5V AT27C020 and uses the same programming equipment.

System Considerations

Switching between active and standby conditions via the Chip Enable pin may produce transient voltage excursions. Unless accommodated by the system design, these transients may exceed data sheet limits, resulting in device non-conformance. At a minimum, a 0.1 μ F high frequency, low inherent inductance, ceramic capacitor should be utilized for each device. This capacitor should be connected between the Vcc and Ground terminals of the device, as close to the device as possible. Additionally, to stabilize the supply voltage level on printed circuit boards with large EPROM arrays, a 4.7 μ F bulk electrolytic capacitor should be utilized, again connected between the Vcc and Ground terminals. This capacitor should be positioned as close as possible to the point where the power supply is connected to the array.

Block Diagram

Absolute Maximum Ratings*

Temperature Under Bias40°0	C to +85°C
Storage Temperature65°C	to +125°C
Voltage on Any Pin with Respect to Ground2.0V t	o +7.0V ⁽¹⁾
Voltage on A9 with Respect to Ground2.0V to	+14.0V ⁽¹⁾
VPP Supply Voltage with Respect to Ground2.0V to	+14.0V ⁽¹⁾

- *NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- Note: 1. Minimum voltage is -0.6V dc which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is V_{CC} + 0.75V dc which may be exceeded if certain precautions are observed (consult application notes) and which may overshoot to +7.0V for pulses of less than 20 ns.

Operating Modes

Mode \ Pin	CE	OE	PGM	Ai	VPP	Vcc	Outputs
Read ⁽²⁾	VIL	ViL	X ⁽¹⁾	Ai	х	Vcc ⁽²⁾	Dout
Output Disable (2)	Х	ViH	Х	х	х	Vcc (2)	High Z
Standby ⁽²⁾	ViH	Х	Х	Х	х	Vcc (2)	High Z
Rapid Program (3)	VIL	ViH	VIL	Ai	VPP	Vcc ⁽³⁾	DIN
PGM Verify ⁽³⁾	VIL	VIL	ViH	Ai	VPP	Vcc ⁽³⁾	Dout
PGM Inhibit ⁽³⁾	VIH	х	Х	х	VPP	Vcc ⁽³⁾	High Z

Notes: 1. X can be VIL or VIH.

- 2. Read, output disable, and standby modes require, $2.7V \le V_{CC} \le 3.6V$, or $4.5V \le V_{CC} \le 5.5V$.
- 4. $V_H = 12.0 \pm 0.5V$. 5. Two identifier bytes
- Refer to Programming Characteristics. Programming modes require V_{CC} = 6.5V.
- 5. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_H and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.

IPP1 ⁽²⁾	VPP (1) Read/Standby Current	VPP = VCC		10	<u>μΛ</u>
ISB	Vcc ⁽¹⁾ Standby Current	I_{SB1} (CMOS), $\overline{CE} = V_{CC} \pm 0.3V$		20	μΑ
		IsB2 (TTL), $\overline{CE} = 2.0$ to V _{CC} + 0.5V		100	μA
	Vcc Active Current	$f = 5 \text{ MHz}, I_{OUT} = 0 \text{ mA}, \overline{CE} = V_{IL}, V_{CC} = 3$	3.6V	8	mA
VIL	Input Low Voltage	V _{CC} = 3.0 to 3.6V	-0.6	0.8	V
		Vcc = 2.7 to 3.6V	-0.6	0.2 x Vcc	v
ViH	Input High Voltage	Vcc = 3.0 to 3.6V	2.0	Vcc + 0.5	V
		Vcc = 2.7 to 3.6V	0.7 x Vcc	Vcc + 0.5	v
		loL = 2.0 mA		0.4	v
Vol	Output Low Voltage	l _{OL} = 100 μA		0.2	v
		l _{OL} = 20 μA		0.1	v
		lон = -2.0 mA	2.4		v
Vон	Output High Voltage	loн = -100 μA	Vcc - 0.2		V
		Іон = -20 μА	Vcc - 0.1		V
$V_{cc} = 4$.5V to 5.5V				
lu –	Input Load Current	VIN = 0V to VCC		±1	μA
ILO	Output Leakage Current	VOUT = 0V to VCC		±5	μA
IPP1 ⁽²⁾	VPP (1) Read/Standby Current	VPP = VCC		10	μA
ISB	Vcc ⁽¹⁾ Standby Current	I_{SB1} (CMOS), $\overline{CE} = V_{CC} \pm 0.3V$		100	μA
	value =	IsB ₂ (TTL), $\overline{CE} = 2.0$ to V _{CC} + 0.5V		1	mA
lcc	Vcc Active Current	$f = 5 \text{ MHz}, I_{OUT} = 0 \text{ mA}, \overline{CE} = V_{IL}$		25	mA
VIL	Input Low Voltage		-0.6	0.8	V
VIH	Input High Voltage		2.0	Vcc + 0.5	V
Vol	Output Low Voltage	lo _L = 2.1 mA		0.4	v
Voh	Output High Voltage	ΙοΗ = -400 μΑ	2.4		V

Notes: 1. Vcc must be applied simultaneously with or before Vpp, and removed simultaneously with or after Vpp.

 VPP may be connected directly to V_{CC}, except during programming. The supply current would then be the sum of I_{CC} and I_{PP}.

AT27BV020

1074177 0010045 703 🔳

Rapid Programming Algorithm

A 100 μ s \overrightarrow{PGM} pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5V and V_{PP} is raised to 13.0V. Each address is first programmed with one 100 μ s \overrightarrow{PGM} pulse without verification. Then a verification/reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 μ s pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. V_{PP} is then lowered to 5.0V and V_{CC} to 5.0V. All bytes are read again and compared with the original data to determine if the device passes or fails.
