CMOS DUAL-PORT RAM
32K (4K x 8-BIT)
IDT7134S
IDT7134L
FEATURES:

- High-speed access
 - Military: 45/55/70ns (max.)
 - Commercial: 35/45/55/70ns (max.)
- Low-power operation
 - IDT7134S
 - Active: 500mW (typ.)
 - Standby: 5mW (typ.)
 - IDT7134L
 - Active: 500mW (typ.)
 - Standby: 1mW (typ.)
- Fully asynchronous operation from either port
- Battery backup operation—2V data retention
- TTL-compatible; single 5V ($\pm 10\%$) power supply
- Available in several popular hermetic and plastic packages
- Military product compliant to MIL-STD-883, Class B

DESCRIPTION:

The IDT7134 is a high-speed 4K x 8 dual-port static RAM designed to be used in systems where on-chip hardware port arbitration is not needed. This part lends itself to those systems which cannot tolerate wait states or are designed to be able to externally arbitrate or withstand contention when both sides simultaneously access the same dual-port RAM location.

The IDT7134 provides two independent ports with separate control, address and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. It is the user's responsibility to ensure data integrity when simultaneously accessing the same memory location from both ports. An automatic power down feature, controlled by $\overline{CE}$, permits the on-chip circuitry of each port to enter a very low standby power mode.

Fabricated using IDT's CEMOS™ high-performance technology, these dual-ports typically operate on only 500mW of power at maximum access times as fast as 35ns. Low-power (L) versions offer battery backup data retention capability, with each port typically consuming 200 μ W from a 2V battery.

The IDT7134 is packaged on either a sidebrase or plastic 48-pin DIP, 48-pin or 52-pin LCC, and 52-pin PLCC. Military grade product is manufactured in compliance with the latest revision of MIL-STD-883, Class B.

PIN CONFIGURATIONS

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Rating	Commercial	Military	Unit
VTERM	Terminal Voltage with Respect to GND	-0.5 to +7.0	-0.5 to +7.0	V
TA	Operating Temperature	0 to +70	-55 to +125	°C
TBIAS	Temperature Under Bias	-55 to +125	-65 to +135	°C
TSTG	Storage Temperature	-55 to +125	-65 to +150	°C
PT	Power Dissipation	1.5	1.5	W
IOUT	DC Output Current	50	50	mA

NOTE: 2696 tbl 01
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

CAPACITANCE (TA = +25°C, f = 1.0MHz)

Symbol	Parameter ⁽¹⁾	Conditions	Max.	Unit
CIN	Input Capacitance	VIN = 0V	11	pF
COUT	Output Capacitance	VOUT = 0V	11	pF

NOTE: 2696 tbl 02
1. This parameter is determined by device characterization but is not production tested.

tDDD	Write Data Valid to Read Data Delay ⁽⁴⁾	—	55	—	55	—	55	—	70	ns

NOTES:

2696 tbl 10

1. Transition is measured $\pm 500\text{mV}$ from low or high impedance voltage with load (Figures 1 and 2).
2. This parameter is guaranteed but not tested.
3. The specification for tDH must be met by the device supplying write data to the RAM under all operating conditions. Although tDH and tOW values will vary over voltage and temperature, the actual tDH will always be smaller than the actual tOW.
4. Port-to-port delay through RAM cells from writing port to reading port, refer to "Timing Waveform of Read with Port-to-Port Delay".
5. 0°C to +70°C temperature range only.
6. Specified for $\overline{\text{OE}}$ at high (refer to "Timing Waveform of Write Cycle", Note 7).

TIMING WAVEFORM OF READ WITH PORT-TO-PORT DELAY⁽¹⁾

NOTES:

2696 drw 09

1. Write cycle parameters should be adhered to in order to ensure proper writing.

TIMING WAVEFORM OF WRITE CYCLE NO. 1, $\overline{R/\overline{W}}$ CONTROLLED TIMING^(1, 2, 3, 4, 6, 7)

2696 drw 10

TIMING WAVEFORM OF WRITE CYCLE NO. 2, $\overline{CE}$ CONTROLLED TIMING^(1, 2, 3, 5)

2696 drw 11

NOTES:

1. $\overline{R/\overline{W}}$ must be high during all address transitions.
2. A write occurs during the overlap (t_{EW} or t_{WP}) of a low $\overline{CE}$ and a low $\overline{R/\overline{W}}$.
3. t_{WR} is measured from the earlier of $\overline{CE}$ or $\overline{R/\overline{W}}$ going high to the end of write cycle.
4. During this period, the I/O pins are in the output state, and input signals must not be applied.
5. If the $\overline{CE}$ low transition occurs simultaneously with or after the $\overline{R/\overline{W}}$ low transition, the outputs remain in the high impedance state.
6. Transition is measured $\pm 500\text{mV}$ from steady state with a 5pF load (including scope and jig). This parameter is sampled and not 100% tested.
7. If $\overline{CE}$ is low during a $\overline{R/\overline{W}}$ controlled write cycle, the write pulse width must be the larger of t_{WP} or $(t_{WZ} + t_{OW})$ to allow the I/O drivers to turn off data to be placed on the bus for the required t_{OW} . If $\overline{OE}$ is high during an $\overline{R/\overline{W}}$ controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP} .

IDT7134S/L
CMOS DUAL-PORT RAM 32K (4K x 8-BIT)

T-46-23-12
MILITARY AND COMMERCIAL TEMPERATURE RANGES

FUNCTIONAL DESCRIPTION:

The IDT7134 provides two ports with separate control, address and I/O pins that permit independent access for reads or writes to any location in memory. These devices have an automatic power down feature controlled by $\overline{CE}$. The $\overline{CE}$ controls on-chip power down circuitry that permits the respective port to go into standby mode when not selected ($\overline{CE}$ high). When a port is enabled, access to the entire memory array is permitted. Each port has its own Output Enable control ($\overline{OE}$). In the read mode, the port's $\overline{OE}$ turns on the output drivers when set LOW. Non-contention READ/ WRITE conditions are illustrated in the table below.

TABLE I – READ/WRITE CONTROL

Left or Right Port ⁽¹⁾				Function
R/W	$\overline{CE}$	$\overline{OE}$	D0-7	
X	H	X	Z	Port Disabled and in Power Down Mode, ISB2 or ISB4
X	H	X	Z	$\overline{CE_R} = \overline{CE_L} = H$, Power Down Mode, ISB1 or ISB3
L	L	X	DATAin	Data on port written into memory
H	L	L	DATAout	Data in memory output on port
X	X	H	Z	High impedance outputs

NOTES:
1. A0L - A11L ≠ A0R - A11R
H = HIGH, L = LOW, X = Don't Care, Z = High Impedance
